(Established under Galgotias University Uttar Pradesh Act No. 14 of 2011)

ONLINE SHOPPING MANAGEMENT SYSTEM

A Report for the Evaluation 3 of Project 2

Submitted by

AMAN SHANKHDHAR

(18032030089 / 18SCSE2030073)

ARUN BHATI

(18032030078/18SCSE2030061)

IN partial fulfilment for the award of the degree

of

MASTER IN COMPUTER APPLICATION

IN

Computer Science and Engineering With Computer Application

SCHOOL OF COMPUTING SCIENCE AND ENGINEERING

Under the Supervision of

Asst. Professor

Mr.Prem Prakash Agrawal

APRIL / MAY- 2020

SCHOOL OF COMPUTING AND SCIENCE AND ENGINEERING

BONAFIDE CERTIFICATE

Certified that this project report "ONLINE SHOPPING MANAGEMENT SYSTEM " is the bonafide work of "AMAN SHANKHDHAR , ARUN BHATI " who carried out the project work under y supervision.

ACKNOWLEDGEMENT

would like to thank for providing us a valuable opportunity in undertaking this project. The extent of moral support floated by them is exemplary and it was a lifetime opportunity to us to work with people like them.

We are thankful to our classmates for their valuable contribution towards this project. We also express regards to our other teachers of MCA Department of GALGOTIAS UNIVERSITY GREATER NOIDA for their valuable guidance and knowledge, which helped us throughout this project.

This acknowledgement would be incomplete if we fail to express our gratitude to our parents who are responsible for education and all round development.

STUDENT PROFILE

We are the student of **MCA VI Semester**. We have done the concept of the database and relational database management system and in this semester we have done Microsoft C#.Net, which is an Object Oriented Relational Data Base Management System.

We have also studied the Object Oriented Programming Concepts in the **C++**, and complete the concepts of **System Analysis And Design and Software Engineering** that helped us to design this project.

We hope to learn more designing packages and programming languages in future, which increase our strangeness in software concepts.

PLATFORM USED

The platform use for this project is Microsoft .Net Framework because it is a GUI based operating system and We have this environment in our computer, and We like to work in this environment also. Many behind-the-scenes improvements have been made to Windows 7 Operating System. Now computing is faster, more fun, and freer than ever before. We can perform simple operations on your pictures, such as rotating and printing, without the need for other software. Windows 7 protects important system files in a new way and keeps your computer running efficiently by using System File Protection. Because many products make use of the same system files, sometimes when we install a product it tries to replace one of those files with its own version that might lack the capabilities that other programs rely on. System File Protection works in the background to make sure such things don't happen.

FRONT END USED

Microsoft ASP.Net is used as a front end programming language. Because ASP.Net is a powerful application development tool for the Web based Application developed by Microsoft with the advent of the Windows environment.

It is used for creating almost all types of Web based programs. ASP.Net is a descendant of ASP, which was often the first language that programmers used to learn in order to become familiar with Server Side programming basics before switching to any other powerful web based language.

ASP.Net is not just a language but it is an Integrated Development Environment. IDE is basically a term commonly used in the programming world to describe the interface and environment where you develop, run, test and debug your applications.

BACK END USED

The Microsoft SQL Server 2005 is an RDBMS and is used as a database handler in back end. The Microsoft SQL Server 2005 is a part of Microsoft based Database Management Applications (a GUI and Network based Database Management System) is very easy to access and also have a good connectivity with the Microsoft ASP.Net as a database handler in backhand.

Microsoft SQL Server 2005 is a Window Based Application and therefore has an Interface similar to its previous versions. All the windows operations (like cut, copy, paste, etc.) can be performing under working with the Microsoft SQL Server 2005 Management Console, but we must have a windows environment to run Microsoft SQL Server 2005.

The Microsoft SQL Server 2005 can store data up to 1GB of our Disk size. And can be stored a maximum of 32,768 Tables and different Objects. A maximum number of 255 Users can work freely at a time on a single Microsoft SQL Server 2005.

PROJECT ANALYSIS

The main objective is to analyze and design software, which provide effective solution by integrating service to the Online Shopping Management System. It helps in -

- Automating routine work function.
- It's provide better management system.
- Reduce data redundancy.
- Reduce manual errors.
- Proper management of time.
- Easily execute on all system.
- It's provide better compatibility to the user.
- It is mostly based on the server.
- To reduce the more paper work & time.
- It is easily conduct on any institute that provide the better lab feature & better server connectivity.

Preparation of transaction documents such as admit cards, students verification etc. is the simplest task that the computer can be put to, the only requirement being that the process of preparation is standard, unchanging and easily specified. The transactional documents are not only prepared for their own-sake, the information they contain is also used to prepare detailed analyses for decision-

making and control. This aspect is called Online Shopping Management System.

FEASIBILITY STUDY & COST/BENEFIT ANALYSIS

During the Feasibility study We evaluates the existing Problems. This study provides me a clear sense of direction for the subsequent development of the benefits to the proposed system. It evaluates other alternative systems, and estimates the feasibility of the system technically and economically to determine that it is must be worthwhile proceed with the project.

A good assembled PC with minimum configuration-

- **Hardware Requirements-**

- Core i3 or Higher processor with 2.10 GHz.
- 2 GB RAM
- 500 GB of Hard Disk Drive
- Color Monitor or TFT Monitor
- 1 Printer (preferably Jet or Desk-jet)

- **Software Requirements-**

- GUI Based Environment or Operating Systems Like (Windows 7) and Microsoft Visual Studio 2008 or above.
- Microsoft SQL Server 2005 database server.

The main objective of computerization is effective management of time and resources. It speeds up the routine process. The paper work gets reduced, which is turn saves time. Decision-making is easier and faster based on the reports obtained as output. Data handling is easier and faster. The User or Agent can easily be verified. Provides efficient service that gives easily User satisfaction.

What is being achieved by implementation of this system? By implementing "Online Shopping Management System" we achieve the objective of automating the Insertion of students and automatically deletion of the students records . This is being done to speed up routine work what they do manually. The computer operator uses this system to input data into computer and obtain formatted information. This software can be extended to other departments (banking, railway, etc.) in the future if they require.

PROJECT DESIGN

The functional description of Online Shopping Management System is as follows-

The computer first of all when start display the messages regarding to the Login. This is for user for only get a valid user to logged in for security reasons. This facility is provided to the users that they may run this program to get enough information that they are eligible to get in.

Then to enter a new student we use to move on File Menu and click on New Registration to open new registration form. Here user have to provide student basic information. And if student have to registered into the records than the system will open.

In the admission form of student user only give the user-id and password the rest of the information will be put from the previous form automatically.

Form Designing

In the form designing concepts we can easily elaborate project in this we can easily describe the form in the projects that play a important role in our project. So in the form designing we can easily represent the form that are used in the project in this we can describe how to manage all the form that are used in the project Most forms are designed using the Forms Designer in Visual Studio .NET. This is not an essential requirement—the designer just generates code that you could write manually instead. It is simply much easier to arrange the contents of a form visually than it is to write code to do this.

When you add a new form to a project, a new class definition is created. The Designer always uses the same structure for the source code of these classes. They begin with private fields in C# and Friend fields in VB to hold the contents of the form. (The Designer inserts new fields here as you add controls to the form.) Nextis the constructor, followed by the Dispose and Initialize Component methods; these are all described below. If this is the main form in your application, the

program's entry point (the Main method described above) will follow in C# programs; in VB programs, it will be added by the compiler at compile time, but will not be displayed with the form's source code. Finally, any event handlers for controls on your form will be added at the end of the class.

The Designer does not make it obvious where you are expected to add any code of your own, such as fields or methods other than event handlers. This is because it doesn't matter—Visual Studio .NET is pretty robust about working around you.

It is even happy for you to move most of the code that it generates if you don't like the way it arranges things, with the exception of the code inside the Initialize Component method, which you should avoid modifying by hand.

Easy Shoppe.com is owned and operated by FutureBazaar India Ltd., a subsidiary of Pantaloon Retail (India) Limited
If you have purchased something at FutureBazaar and the product did not meet your expectations or does not fit your needs, then you can return the product to us; no questions asked, as long as it is in its original packaging and accompanied by its invoice. We will even make the return process simple for you – just contact our customer support and we'll arrange to pick up the product from your home. Alternately, you can drop it off at the nearest Big Bazaar.
As part of India's largest retail chain, we enjoy the benefits of buying in bulk for the entire group and keep our margins low, so you get a great range of products at great prices. We pass these benefits on to you, so our prices are the lowest we can make – every day
Big Bazaar was awarded the CNBC-Awaaz Consumer Awards in 2006 and the Readers' Digest Platinum Brand Award 2006. Further details on Pantaloon Retail are available on http://www.pantaloon.com/
Pantaloon Retail was selected as the Best of Best Retailers in Asia by Retail Asia-Pacific Top 500 magazine in 2006.
Pantaloon Retail (India) Limited led by Kishore Biyani is the country's largest retailer. It owns and operates multiple retail formats including Pantaloons, Big Bazaar, Food Bazaar, Central, E-Zone, Fashion Station, Depot and many others. Headquartered in Mumbai, Pantaloon Retail is listed on BSE and NSE with a turnover of Rs 2,018 crores for financial year ended 2005-06.

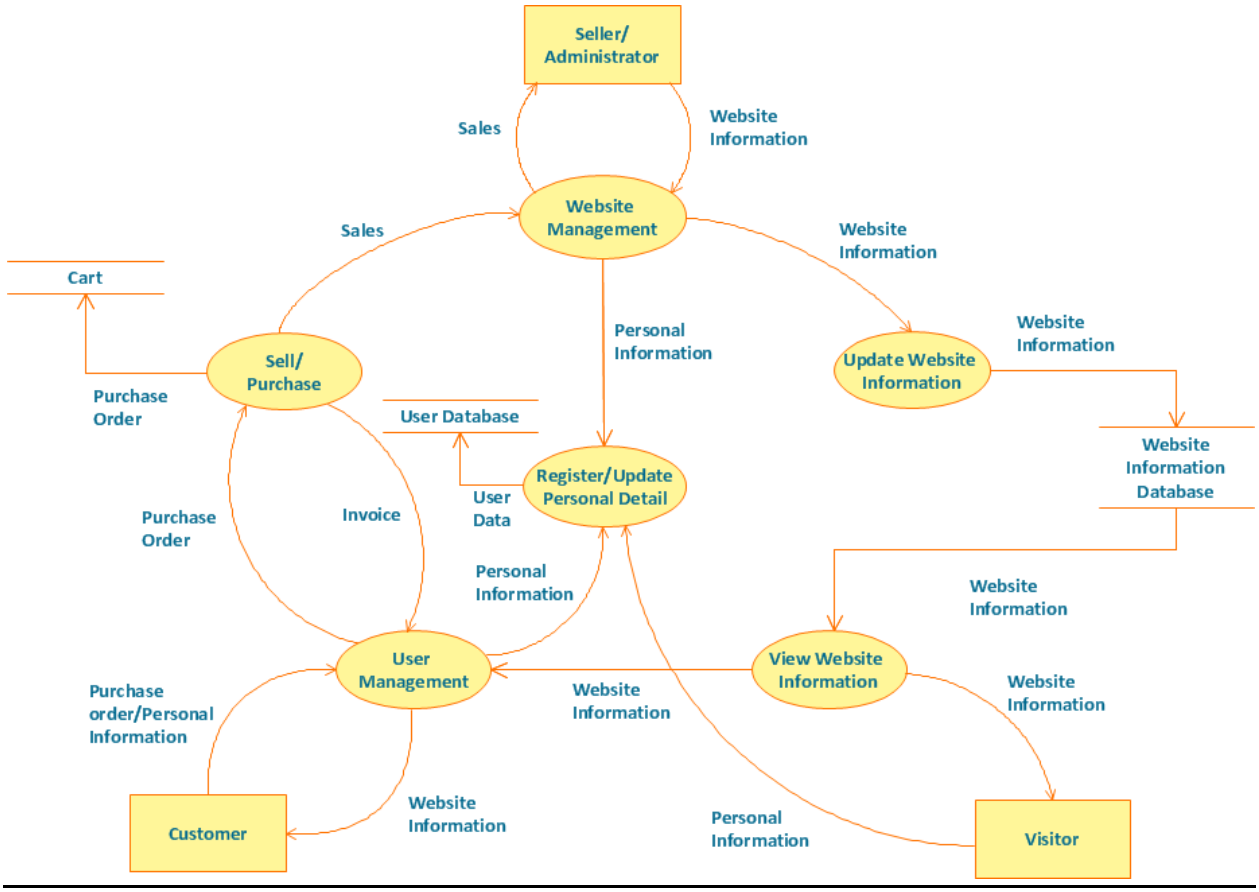
Data-Flow Diagram



Testing Mechanisms used

Testing is the process of making necessary corrections of errors to the programs, procedures and hardware used by a new system. In adequate or non/tested system may lead to errors that may take several months to appear. A newly developed system is tested on the following basis-

(1) **Online response –**Online systems must have a response time that will not cause a hardship to the user. One way to test this is to input transactions on as many CRT screen as would normally used in peak hours and time response to each online function to establish a true performance level.

(2) **Volume-**In this test, as many records are created as would normally be produced to verify that the hardware and software will functions correctly.

(3) **Stress Testing-**The purpose of stress testing is to prove that the system does not malfunction under peak loads. Unlike volume testing, where time is not a factor, we subject the system to a high volume of data over a short time period. This stimulates an online environment where a high volume of activities accrues in spurts.

(4) **Recovery and Security-**A forced system failure is induced to test backup recovery procedure for file integrity. In accurate are entered to see how the system responds in terms of error detection and protection. Related to file integrity is a test to demonstrate that data and programs are secure from unauthorized access.

(5) **Usability and Procedure-** The usability test verifies the user-friendly nature of the system. This relates to normal operating and error handling procedures.

Testing objectives-

(1) Testing is a process of executing a program with the intent of finding and error.

(2) A successful test is one that uncovers and as yet undiscovered error.

Types of Testing-

Testing is of the following types-

(1) **Unit Testing-**In unit testing, each components or part of the system is tested individually. The system programmer does this testing. This type of testing is restrictive in nature, i.e., the programmer should try to test all invalid conditions and ensure that the program does not break under any circumstances.

(2) **Module Testing-**This testing is an optional form of testing. Which is done only for large systems having voluminous modules.

(3) **System Testing-**This is an integrated form of testing which focuses on functionality and interfaces between units or modules. System testing is more effective when an independent team in a controlled environment does it.

(4) **Acceptance testing-**The user of the system does this testing. The emphasis of this is on the user acceptance for the functionality of the system. This testing is done in a controlled environment with logging of all errors found in the system.

Depending on the errors and interactive ness, the user may decide to either accept or reject the system.

(5) **Security Testing-**Security testing is done in a specialized from when there is a high-risk expositor a certain area of the system. If the risk of exposure is not very high, then it can be done as a part of the system testing. Typically, security testing would involve trying to break into system, trying to execute transaction not allowed to a person, trying to access areas on disk where the user is not allowed.

Conclusion

This project is only for performing the Online Shopping Management System and this project is only for working with Client Server Architecture. But a large Institution has different courses for different working streams so we will try to make it working onto the large scale.

Many more things are there to be implemented in this project but we are not so professional and to manage the basic requirements we have completed this project.
