CLIENT SOLUTION (EMS)

A Report for the Final evaluation of Project 2

Submitted by

MOHAMMAD ASIM

(1613101396)

in partial fulfilment for the award of the degree of

**BACHELOR OF TECHNOLOGY
IN
COMPUTER SCIENCE AND ENGINEERING**

SCHOOL OF COMPUTING SCIENCE AND ENGINEERING

**Under the Supervision of
Dr. D RAJESH KUMAR, B.E., M.Tech., Ph.D
Associate Professor**

APRIL / MAY- 2020

SCHOOL OF COMPUTING AND SCIENCE AND ENGINEERING

BONAFIDE CERTIFICATE

Certified that this project report "**CLIENT SOLUTION(EMS)**" is the bonafide work of "**MOHAMMAD ASIM**" who carried out the project work under my supervision.

ABSTRACT

In this of growing technologies everythings has been computerized.with large number of work opportunities the human workforce has increased. Thus there is a need of system which can handle the data of such a large number of employees in an organization.This project simplifies

the task of maintain records because of its user friendly nature.

The “CLIENT SOLUTION ” has been developed to override the problem prevailing in the practicing manual system.This software suported to eliminate the and in some cases reduce the hardship face by this existing system.Moreover this system is design for the perticular need of the company/firm to carry out the operations in a smooth and effective manner.

This application is reduced as much as possible to avoid errors while entering the data.It also provide error message while entering invalid data.No formal knowledge is needed for the user to use the system.Thus by this all it proves it is user-friendly.

1.

INTRODUCTION

You're Client solution objective is to provide a system which manages the employee details, the payroll activities done in a company depending upon the employee's attendance and its calculation is very huge. The users will consume less amount of time through computerized system rather than working manually. The system will take care of all the payroll activities like managing each employee's attendance, number of leaves taken by that particular employee and calculation of salary in very quick manner

Data storage is easier. Paper work will be reduced and the company staffs spend more time on monitoring the progress. The system is user friendly and easy to use. All the important data's will be stored in a database and it avoids miscalculation. Admin has the authority to add employee details. And he also has the right to edit or delete employee information to/from the list. Admin provides unique username and password for each employee through which he can login and all the information is stored in database.

1.1 Overall description

- I. **Client sol** is a distributed application, developed to maintain the details of **employees** working in any organization.

- II. It maintains the information about the personal details of their **employees**, also the details about the **payroll system** which enable to generate the payslip.
- III. An **Client sol** consists of crucial work-related and important personal information about an **employee**.
- IV. In a nutshell, it is an online inventory of all employees of an organization.
- V. Employees are the strength of any organization, and it is more so in case of a growing business.

1.2 Purpose

Client solutions are designed to better measure, analyze and **manage employees'** working hours and deploy human resources more effectively. **Client solution** is open to admins, HR team, Managers, and regular **employees**. The main **objective** of the **Java Project** on **Client solution** is to **manage** the details of Salary, Leaves, **Employee**, Experience, Informations. It manages all the information about Salary, Login, Informations, Salary.

1.3 Motivations and scope

The scope of this project will be limited to the following:

- Employee profiles: Employees will have access to their personal profiles and will be able to edit their details.
- Electronic leave application: Complete elimination of paperwork in leave management by enabling an employee apply for leave as well as check their leave status through the system. This will also enable the HR manager to accept/reject leave application through the system.
- Project Management: Assign tasks and projects to employees, assign a project team and keep track of the progress.
- Report generation: The HR manager will be able to generate timely reports in order to monitor employees and this can be used for performance appraisals. The reports will be have all the information of an employee from educational background, trainings attended, projects done as well as technical skills

2.Literature Survey

An organization or company with a very large number of employees manages a greater volume of data. This activity can be daunting without a more sophisticated tool to store and retrieve data. The various levels of sophistication can be examined by looking at the evolutionary aspects of HR technology. These aspects can be characterized into four stages of development: Paper-based systems, early personal computer (PC) technology, electronic databases.

The benefits of automation are becoming widely known to HR and other areas of the business. The focus has shifted to automating as many transactions as possible to achieve effectiveness and efficiencies.

There are a number of software development methodology each of which are adopted based on a number of factors relating to the project e.g. Time, cost, incorporation of requirement changes during the development process, system complexity, communication between customers and developers, software criticality, size of the development team. These generic models are not definitive descriptions of software processes. Rather, they are abstractions of the process that can be used to explain different approaches to software development. You can think of them as process frameworks that may be extended and adapted to create more specific software engineering processes.

3. Problem Statement

Manual handling of employee information poses a number of challenges. This is evident in procedures such as leave management where an employee is required to fill in a form which may take several weeks or months to be approved. The use of paper work in handling some of these processes could lead to human error, papers may end up in the wrong hands and not forgetting the fact that this is time consuming. A number of current systems lack employee self-service meaning employees are not able to access and manage their personal information directly without having to go through their HR departments or their managers. Another challenge is that multi-national companies will have all the employee information stored at the headquarters of the company making it difficult to access the employee information from remote places when needed at short notice.

The aforementioned problems can be tackled by designing and implementing a web based HR management system. This system will maintain employee information in a database by fully privacy and authority access. The project is aimed at setting up employee information system about the status of the employee, the educational background and the work experience in order to help monitor the performance and achievements of the employee through a password protected system.

4.EXISTING SYSTEM

The problem definition for designing the system is to maintain data of employee, to make easy controlling employees, to divide jobs and access control of employees, to use technology for accurate and timely processing by fully privacy and full authority access. The objective of the project is to set up employee information system about status of employee and attendance of employee and monthly salary process and delivery. To eliminate or reduce as much as possible the hardships of existing system and avoid errors while entering data. . In existing method employee management are employee record are maintaining in records. It's a manual process. Complicated to search the employee salary

Disadvantages:

- Needs for extra manual effort.
- In existing system is standalone process normal employee cannot track their employee status.
- Less Accuracy Danger of losing some files.
- Certain required report is not available Time consuming process.

given task and cover the basic requirements. The Interface of the program should be user-friendly, and the program should be as easy for use as it is possible. Both controls and forms

should logically and functionally be related within the program and fully respond to the structure of the database

5.PROPOSED MODEL

This chapter builds on the work done in the Analysis Chapter and gives documentation for the Design of the Client solution. The Client solution is modelled in terms of objects and classes and their interactions with each other. Explanation of the proposed system is done as well structure of the Entity Relationship Diagram (ERD). Design of the User Interface is also discussed. The proposed system is designed to eliminate all the drawbacks of the existing employee management software. The system shall be responsible for maintaining information about employees, thus their personal profile. The system shall incorporate leave management all the way from application to acceptance/rejection of leave requests as well as all employee projects with close monitoring of the projects from creation to completion and trainings to assist in monitoring active and inactive employees. The main features to be added include:

- Employee profiles
- Leave management
- Task management
- Notifications
- Employee Self-Service (ESS)

Consistent- The website should have a similar look and feel on every page. Every page should

have the same header/logo, heading style, fonts, navigations etc. Efficient and easy to maintain-

This refers to the fact that there is need to separate content from layout, so that you can easily

change your page design without editing every page on the site

Easy to navigate and use- Users should not have a hard time trying to navigate the site.

Navigation links should be consistent and clearly labelled. All navigation links should also be

working properly and should point to the intended page/site.

Visually appealing- The use of color, text, fonts and graphics should be carefully considered and

used to ensure that the site is visually appealing to its visitors.

5.1 Features:

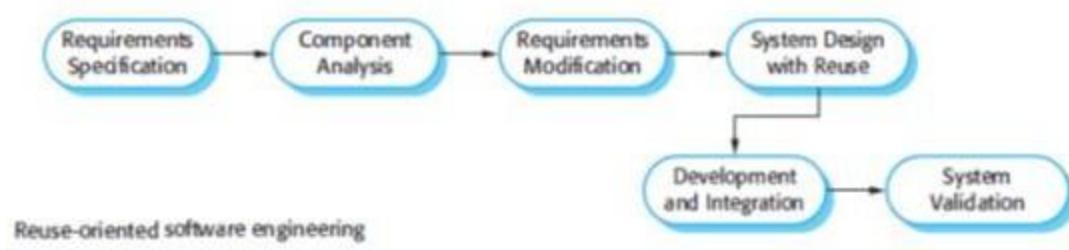

- Portability
- Compatibility
- Secure
- User Friendly
- Generosity
- Runtime Compactness and Speed

5.2 Reuse-oriented methodology:

This approach is based on the existence of a significant number of reusable components. The

system development process focuses on integrating these components into a system rather than

developing them from scratch.

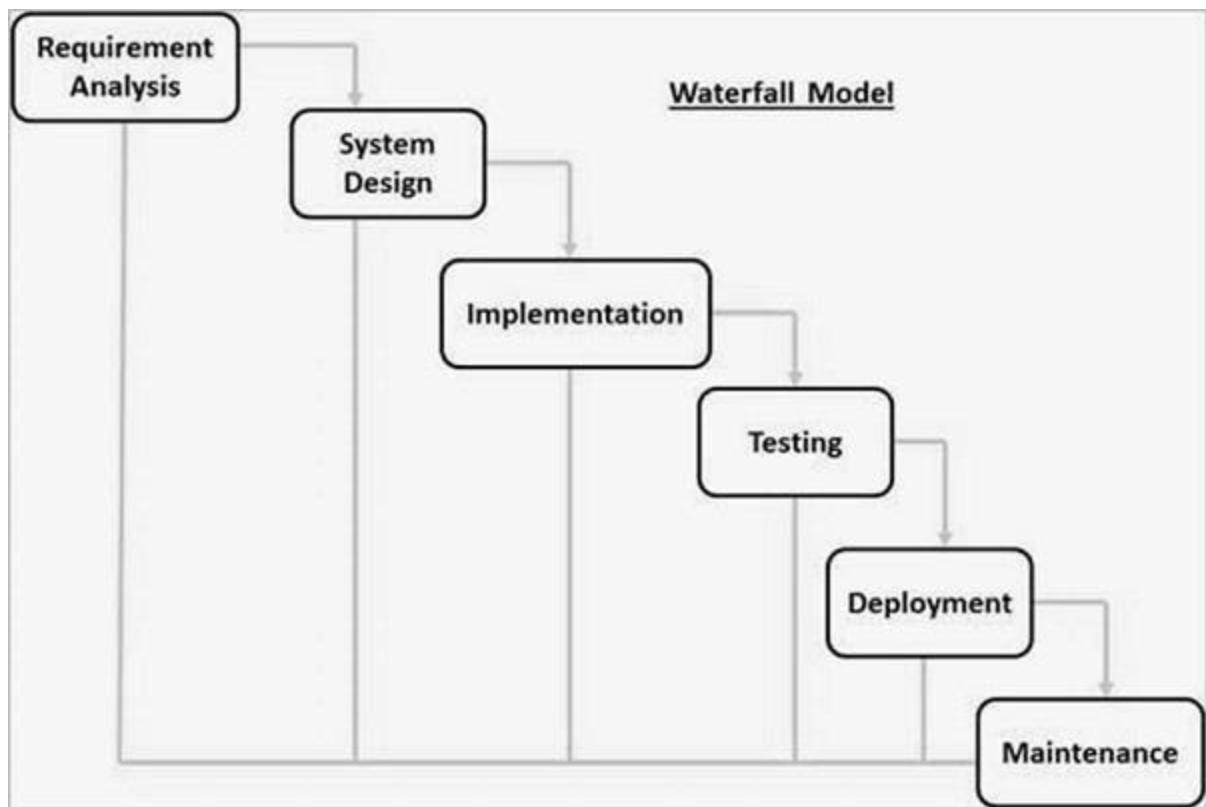

6.SOFTWARE METHODOLOGIES:

A software development methodology is a collection of procedures, techniques, tools, and documentation aids which will help the systems developers in their efforts to implement a new information system.

There are a number of software development methodology each of which are adopted based on a number of factors relating to the project e.g. Time, cost, incorporation of requirement changes during the development process, system complexity, communication between customers and developers, software criticality, size of the development team. These generic models are not definitive descriptions of software processes. Rather, they are abstractions of the process that can be used to explain different approaches to software development. You can think of them as process frameworks that may be extended and adapted to create more specific software engineering processes. Below are a selected number of models:

6.1 The Waterfall Model

The waterfall model is a sequential design process, often used in software development processes. It takes the fundamental process activities of specification, development, validation, and evolution and represents them as separate process phases such as requirements specification, software design, implementation, testing, and so on.

6.2 Incremental Model:

This approach interleaves the activities of specification, development, and validation. The system is developed as a series of versions (increments), with each version adding functionality to the previous version.

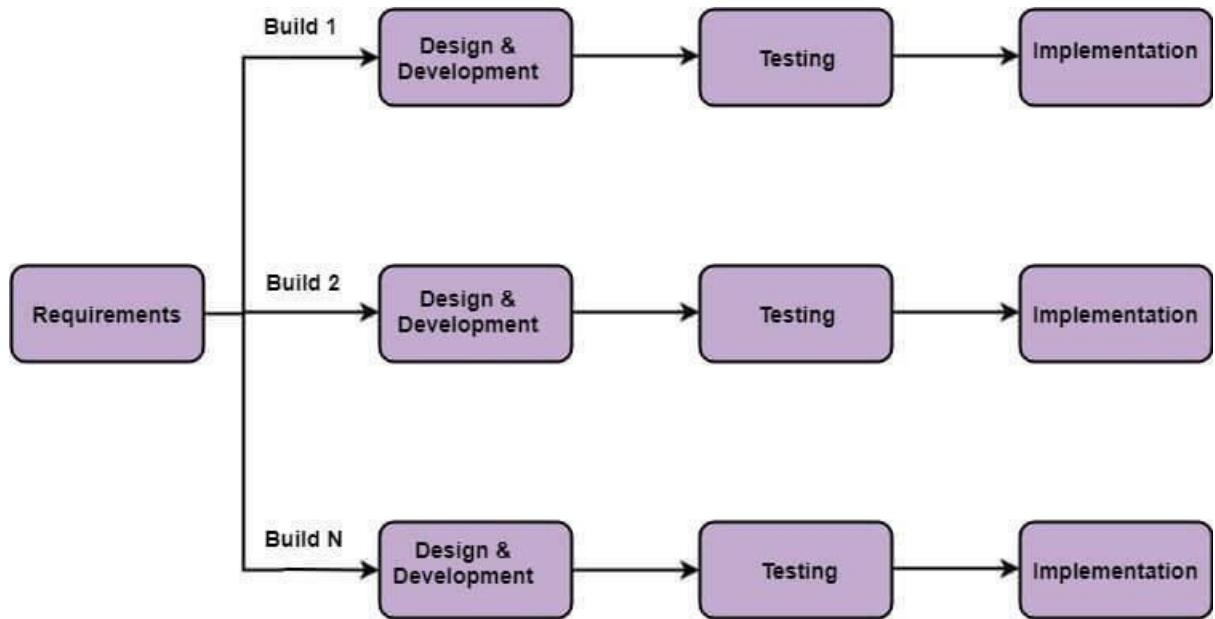

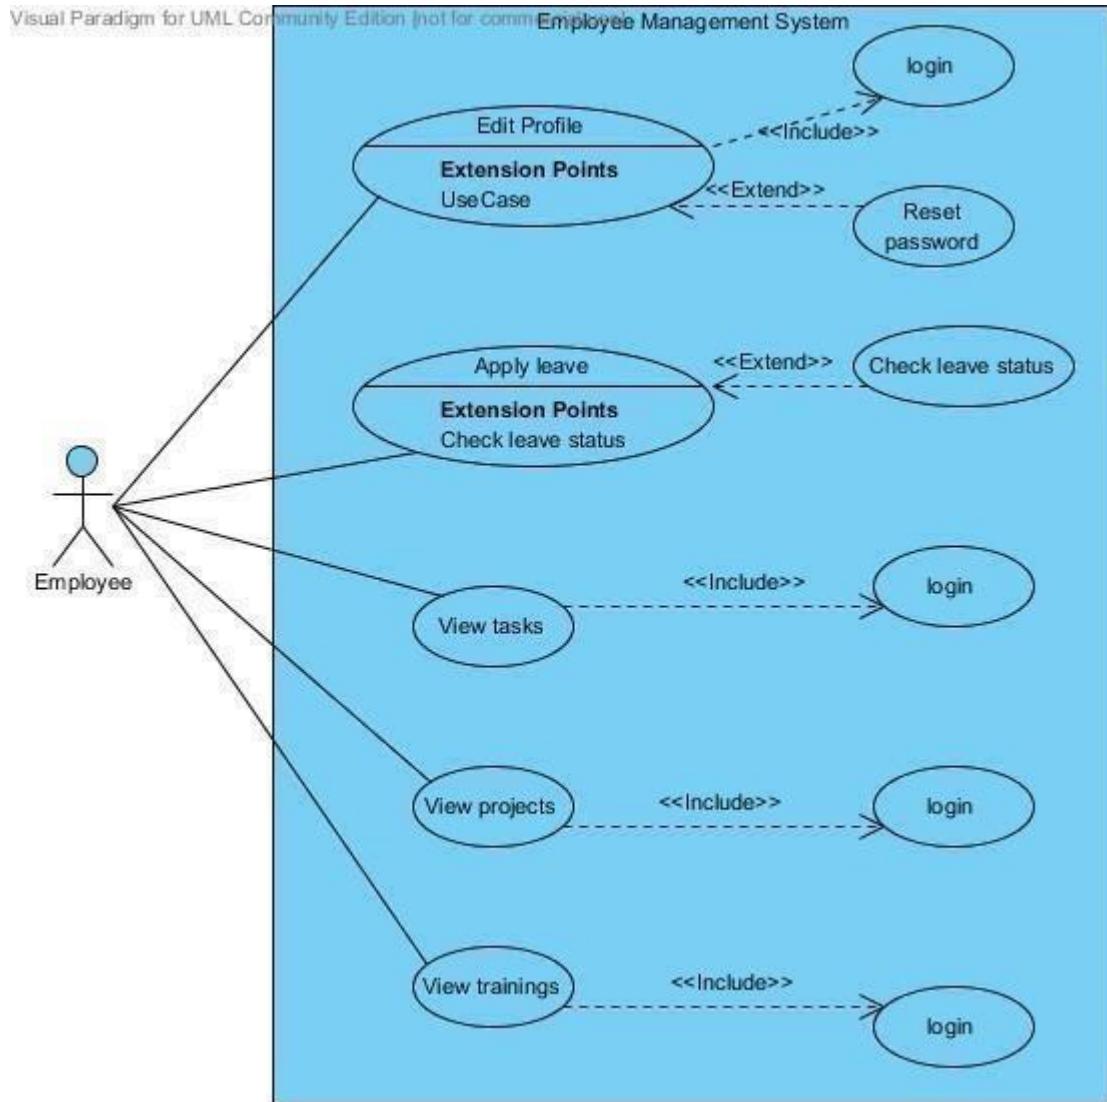

Fig: Incremental Model

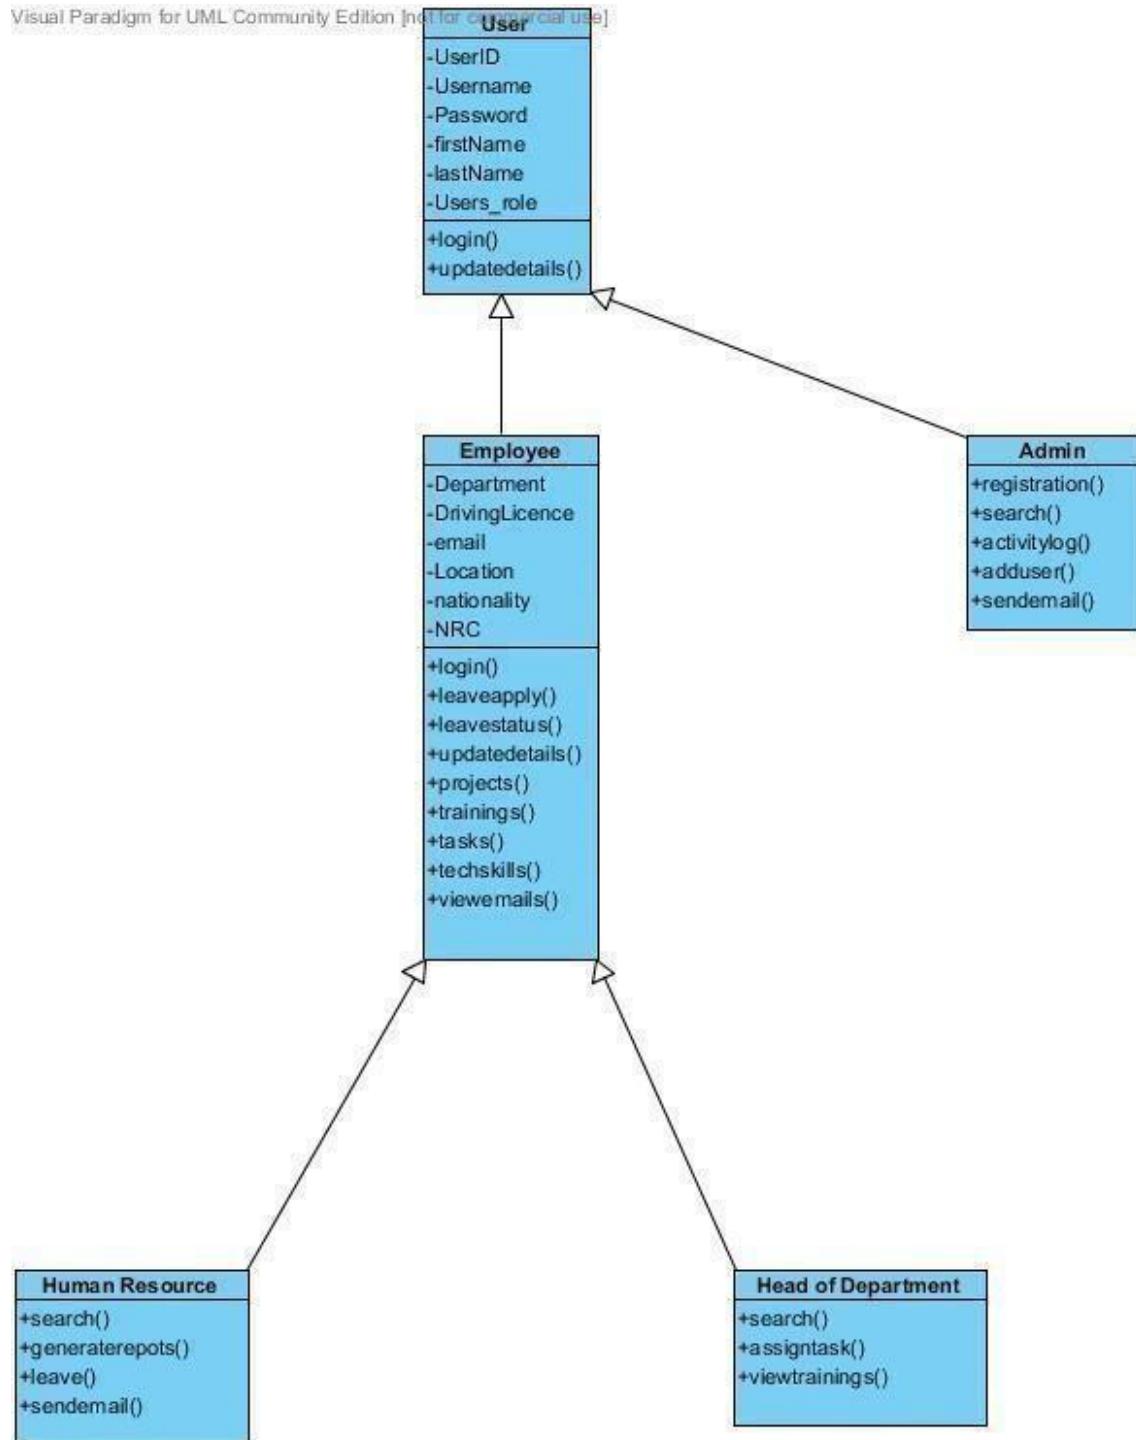

7.SYSTEM DESIGN:

7.1 Use case analysis

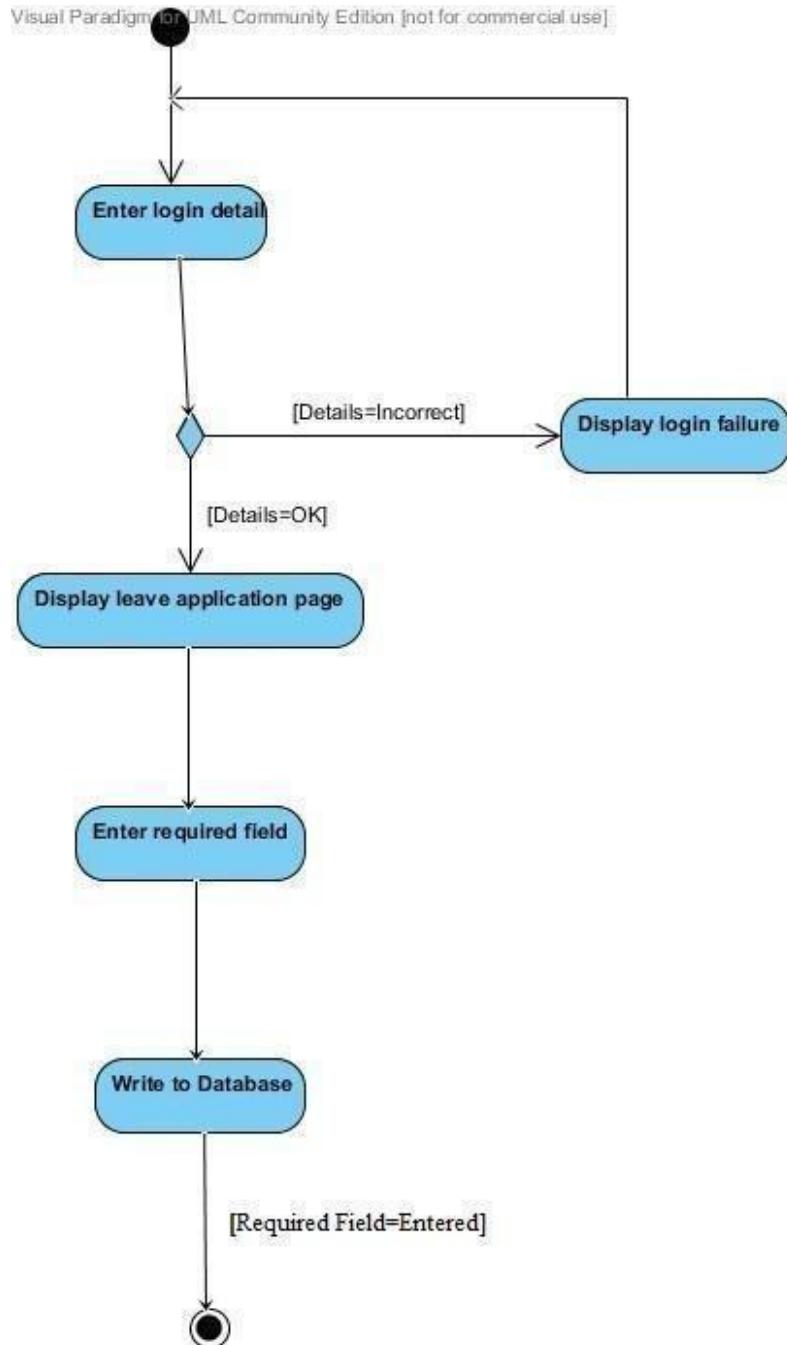

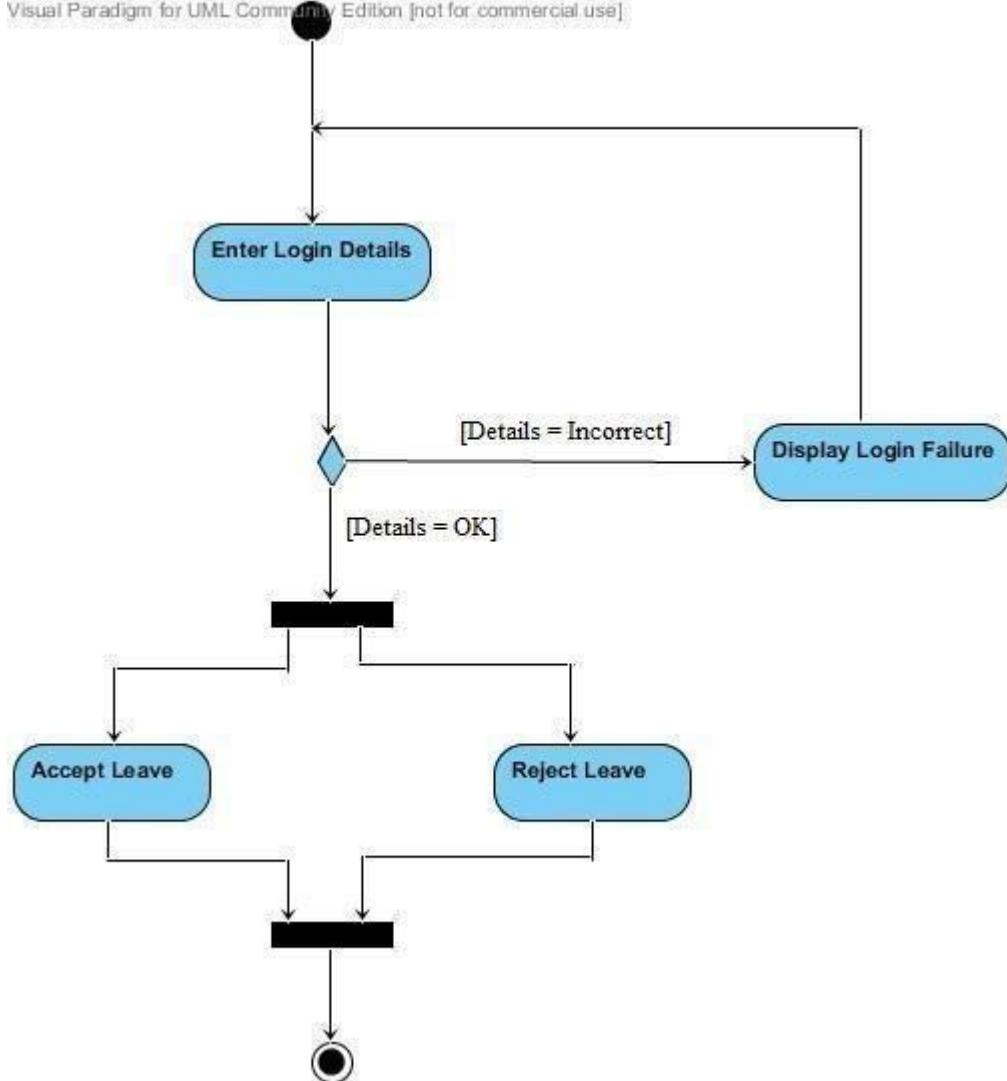

(Employee use case)

7.2 Class diagram:

7.3 SYSTEM AND ALGORITHM FLOWCHARTS

(Leave Acceptance/Rejection)

8.IMPLEMENTATION

All these features include the ability to add user, update (edit), and retrieve through search results. It also contains a report generation system that can be saved in a pdf file format. The system works in the following manner, Accessing the system Various companies and organizations may have different employee structures and hierarchy. All users are presented with the same login interface. User must login the system by means of valid username/password combination. After access is granted to the system, the admin can add a new user to the system by entering the basic information which are the full names and email address. The admin also assigns the new user a role which will determine the access level. During the process of user registration, the all users are issued with a unique username and password combination. Seeing that the system holds private employee information, the admin has the ability to monitor all activity logs into the system by date and time.

8.1 Oracle Database

Oracle database is a powerful relational database management system that has a number of features . In today's market, oracle database management systems are one of the most popular and fulfill featured databases. Oracle databases are widely used as backend database systems for most enterprise applications because they are robust and secure. Oracle is a power hungry database that

requires a lot of system resources to function properly.

(Client_info table)

9. Software requirements:-

1. Web browser-Google chrome/internet explorer/Mozilla firefox.
2. IDE(integrated development environment)-Netbeans.
3. Database-Oracle
4. Operating System-Windows7/windows10(64 bit OperatingSystem)
5. Programming languages-Java,SQL

10.Hardware requirements:-

- 1.4GB RAM
2. 500GB Hard disk(minimum)
3. Intel(R) Core(TM) i3 3120M CPU @2.50 GHz
4. Monitor Resolution 1024 X 768 or higher.
5. Internet Connection Broadband (high-speed) Internet connection with aspeed of 4 Mbps orhigher.
6. Keyboard and a Microsoft Mouse or some other compatible pointing device.

11. CONCLUSION

Overall, the system is useful for all the users to maintain information at various levels. It connects admin and employee and thus easy to maintain. Now admin can easily set the task or any notifications to the respective employees without having a person to send to employees and employees can apply for leave or reply with task allotted to them. It has been a great pleasure for me to work on this exciting and challenging project. This project proved good for us as it provided practical knowledge of not only programming in JAVA and Oracle database Server Developer working of webbased application, but also about all handling procedure related with Advance and new technology. It also provides knowledge about the latest technology used in developing web enabled application and client server technology that will be great demand in future. This will provide better opportunities and guidance in future in developing projects independently.

12. FUTURE ENHANCEMENT:-

Client solution. **Client solution** is a distributed application, developed to maintain the details of **employees** working in any organization. It maintains the information about the personal details of their **employees**, also the details about the payroll **system** which enable to generate the payslip.
