

## Lecture-12

### Raw String:

A **Python raw string** is a normal **string**, prefixed with a **r** or **R**. This treats characters such as backslash ('\') as a literal character. This also means that this character will not be treated as an escape character.

Conversely, prefixing a special character with `"\"` turns it into an ordinary character. This is called "escaping". For example, `"\"` is the single quote character. `'It\'s raining'` therefore is a valid string and equivalent to `"It's raining"`. Likewise, `\"` can be escaped: `\"hello\"` is a string begins and ends with the literal double quote character. Finally, `\"` can be used to escape itself: `\"` is the literal backslash character.

```
>>> print 'It\'s raining
```

```
'It's raining
```

```
>>> 'It\'s raining'    # Same string specified differently
```

```
"It's raining"
```

```
>>> print "\"hello\""
```

```
"hello"
```

```
>>> print "\\\""
```

```
is the backslash'    # Try with "\" instead of "\\\""
```

Course Name: Programming Using Python

Raw strings do not treat the backslash as a special character at all. Every character you put into a raw string stays the way you wrote it –

```
print 'C:\\nowhere'
```

When the above code is executed, it produces the following result –

C:\\nowhere Now let's make use of raw string. We would put expression in **r'expression'** as follows –

```
print r'C:\\nowhere'
```

When the above code is executed, it produces the following result –

```
C:\\nowhere
```

## Unicode String

Normal strings in Python are stored internally as 8-bit ASCII, while Unicode strings are stored as 16-bit Unicode. This allows for a more varied set of characters, including special characters from most languages in the world. I'll restrict my treatment of Unicode strings to the following –

```
print u'Hello, world!'
```

When the above code is executed, it produces the following result –

Hello, world!

## Built-in String Methods:

Python includes the following built-in methods to manipulate strings –

Sr.No.	Methods with Description
1	<a href="#"><u>capitalize()</u></a> Capitalizes first letter of string
2	<a href="#"><u>center(width, fillchar)</u></a> Returns a space-padded string with the original string centered to a total of width columns.
3	<a href="#"><u>count(str, beg= 0,end=len(string))</u></a> Counts how many times str occurs in string or in a substring of string if starting index beg and ending index end are given.
4	<a href="#"><u>decode(encoding='UTF-8',errors='strict')</u></a> Decodes the string using the codec registered for encoding. encoding defaults to the default string encoding.

# School of Basic and Applied Sciences

Course Code : BSCM 304

Course Name: Programming Using Python

Sr.No.	Methods with Description
5	<a href="#">encode(encoding='UTF-8',errors='strict')</a> Returns encoded string version of string; on error, default is to raise a ValueError unless errors is given with 'ignore' or 'replace'.
6	<a href="#">endswith(suffix, beg=0, end=len(string))</a> Determines if string or a substring of string (if starting index beg and ending index end are given) ends with suffix; returns true if so and false otherwise.
7	<a href="#">expandtabs(tabsize=8)</a> Expands tabs in string to multiple spaces; defaults to 8 spaces per tab if tabsize not provided.
8	<a href="#">find(str, beg=0 end=len(string))</a> Determine if str occurs in string or in a substring of string if starting index beg and ending index end are given returns index if found and -1 otherwise.
9	<a href="#">index(str, beg=0, end=len(string))</a> Same as find(), but raises an exception if str not found.
10	<a href="#">isalnum()</a> Returns true if string has at least 1 character and all characters are alphanumeric and false otherwise.
11	<a href="#">isalpha()</a> Returns true if string has at least 1 character and all characters are alphabetic and false otherwise.

Name of the Faculty: Dr. O P Verma

Program Name: B.Sc. (Mathematics)

# School of Basic and Applied Sciences

Course Code : BSCM 304

Course Name: Programming Using Python

Sr.No.	Methods with Description
12	<a href="#">isdigit()</a> Returns true if string contains only digits and false otherwise.
13	<a href="#">islower()</a> Returns true if string has at least 1 cased character and all cased characters are in lowercase and false otherwise.
14	<a href="#">isnumeric()</a> Returns true if a unicode string contains only numeric characters and false otherwise.
15	<a href="#">isspace()</a> Returns true if string contains only whitespace characters and false otherwise.
16	<a href="#">istitle()</a> Returns true if string is properly "titlecased" and false otherwise.
17	<a href="#">isupper()</a> Returns true if string has at least one cased character and all cased characters are in uppercase and false otherwise.

# School of Basic and Applied Sciences

Course Code : BSCM 304

Course Name: Programming Using Python

Sr.No.	Methods with Description
18	<a href="#">join(seq)</a> Merges (concatenates) the string representations of elements in sequence seq into a string, with separator string.
19	<a href="#">len(string)</a> Returns the length of the string
20	<a href="#">ljust(width[, fillchar])</a> Returns a space-padded string with the original string left-justified to a total of width columns.
21	<a href="#">lower()</a> Converts all uppercase letters in string to lowercase.
22	<a href="#">lstrip()</a> Removes all leading whitespace in string.
23	<a href="#">maketrans()</a> Returns a translation table to be used in translate function.

# School of Basic and Applied Sciences

Course Code : BSCM 304

Course Name: Programming Using Python

Sr.No.	Methods with Description
24	<a href="#">max(str)</a> Returns the max alphabetical character from the string str.
25	<a href="#">min(str)</a> Returns the min alphabetical character from the string str.
26	<a href="#">replace(old, new [, max])</a> Replaces all occurrences of old in string with new or at most max occurrences if max given.
27	<a href="#">rfind(str, beg=0, end=len(string))</a> Same as find(), but search backwards in string.
28	<a href="#">rindex( str, beg=0, end=len(string))</a> Same as index(), but search backwards in string.
29	<a href="#">rjust(width,[, fillchar])</a> Returns a space-padded string with the original string right-justified to a total of width columns.
30	<a href="#">rstrip()</a> Removes all trailing whitespace of string.
31	<a href="#">split(str="", num=string.count(str))</a> Splits string according to delimiter str (space if not provided) and returns list of substrings; split into at most num substrings if given.

Name of the Faculty: Dr. O P Verma

Program Name: B.Sc. (Mathematics)

# School of Basic and Applied Sciences

Course Code : BSCM 304

Course Name: Programming Using Python

Sr.No.	Methods with Description
32	<a href="#">splitlines( num=string.count('\n'))</a> Splits string at all (or num) NEWLINEs and returns a list of each line with NEWLINEs removed.
33	<a href="#">startswith(str, beg=0,end=len(string))</a> Determines if string or a substring of string (if starting index beg and ending index end are given) starts with substring str; returns true if so and false otherwise.
34	<a href="#">strip([chars])</a> Performs both lstrip() and rstrip() on string.
35	<a href="#">swapcase()</a> Inverts case for all letters in string.
36	<a href="#">title()</a> Returns "titlecased" version of string, that is, all words begin with uppercase and the rest are lowercase.
37	<a href="#">translate(table, deletechars="")</a> Translates string according to translation table str(256 chars), removing those in the del string.

Sr.No.	Methods with Description
38	<a href="#">upper()</a> Converts lowercase letters in string to uppercase.
39	<a href="#">zfill (width)</a> Returns original string leftpadded with zeros to a total of width characters; intended for numbers, zfill() retains any sign given (less one zero).
40	<a href="#">isdecimal()</a> Returns true if a unicode string contains only decimal characters and false otherwise.
