

(Synchronous Optical Network)

GALGOTIAS
UNIVERSITY

What is SONET?

- Synchronous Optical Networking (**SONET**) and Synchronous Digital Hierarchy (**SDH**) are standardized protocols that transfer multiple digital bit streams synchronously over optical fiber using lasers or highly coherent light from light-emitting diodes (LEDs).
- At low transmission rates data can also be transferred via an electrical interface.
- The method was developed to replace the Plesiochronous Digital Hierarchy (**PDH**) system for transporting large amounts of telephone calls and data traffic over the same fiber without synchronization problems.

UNIVERSITY

Introduction

Independently developed in USA & Europe

SONET (Synchronous Optical Network)

SDH (Synchronous Digital Hierarchy)

- Synchronous network using synchronous TDM multiplexing All clocks in the system are locked to a master clock
- It contains the standards for fiber-optic equipments
- A bit-way implementation providing end-to-end transport of bit streams. Multiplexing done by *byte interleaving*.
- SONET commonly transmits data at speeds between 155 megabits per second (Mbps) and 2.5 gigabits per second (Gbps).
- One of SONET's most interesting characteristics is its support for a ring topology .

SONET LAYERS

- SONET defines four layers: path, line, section, and photonic layer
- Path layer is responsible for the movement of a signal from its optical source to its optical destination
- Line layers is for the movement of a signal across a physical line
- Section layer is for the movement of a signal across a physical section, handling framing, scrambling, and error control
- Photonic layer corresponds to the physical layer of OSI model

SONET ARCHITECTURE

- Architecture of a SONET system: signals, devices, and connections
- Signals: SONET(SDH) defines a hierarchy of electrical signaling levels called STSs (Synchronous Transport Signals, (STMs)).
- Corresponding optical signals are called OCs (Optical Carriers)
- Devices: STS Multiplexer/ Demultiplexer, Regenerator, Add/Drop Multiplexer and Terminals
- Connections: SONET devices are connected using *sections*, *lines*, and *paths*

GALGOTIAS
UNIVERSITY

SONET FRAMES

a. STS-1 frame

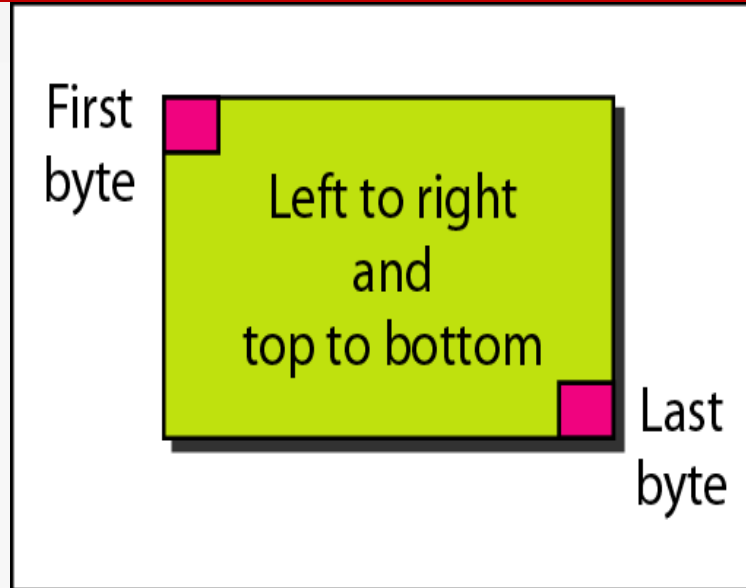

b. STS-n frame

School of Electrical, Electronics and Communication

Course Code : BECE3016

Course Name: OPTICAL COMMUNICATION

a. Byte transmission

b. Frame transmission

A SONET STS- n signal is transmitted at 8000 frames per second

Each byte in a SONET frame can carry a digitized voice channel

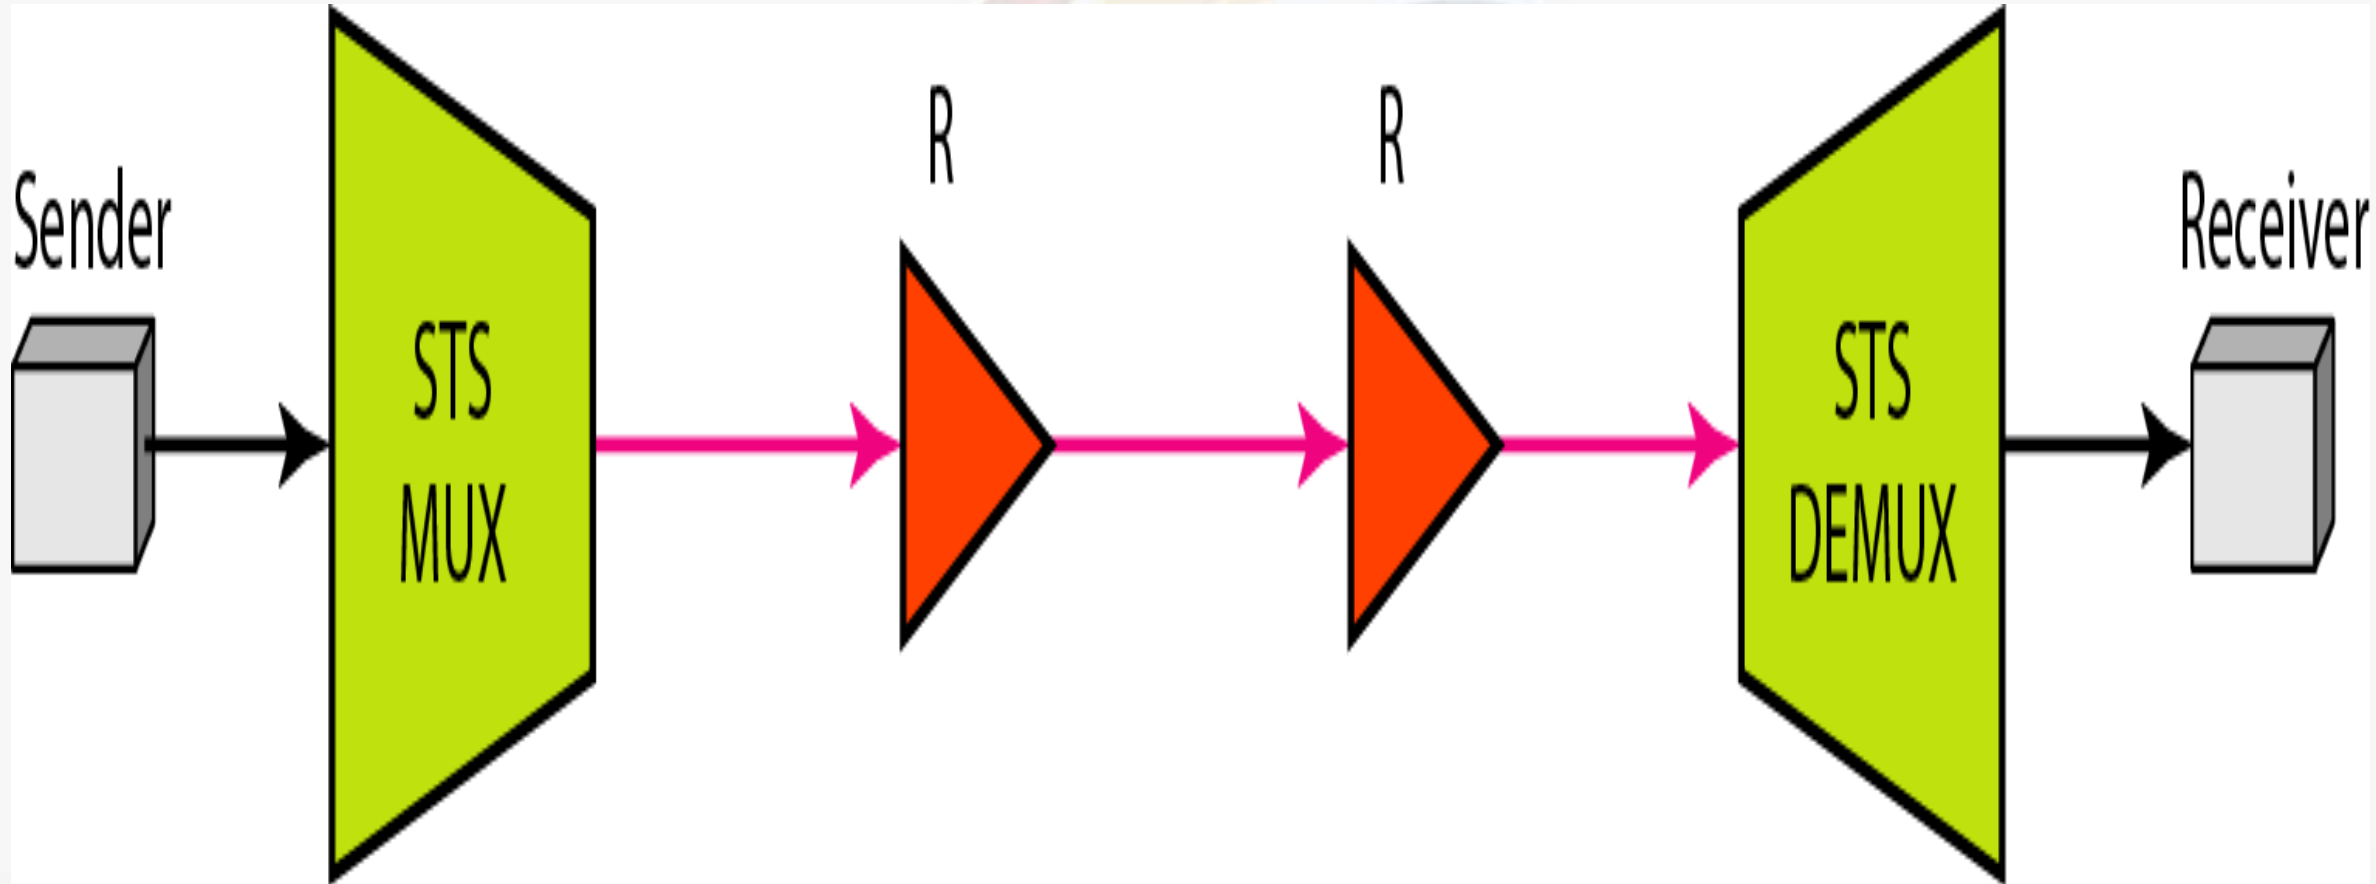

In SONET, the data rate of an STS- n signal is n times the data rate of an STS-1 signal

In SONET, the duration of any frame is 125 μ s

SONET NETWORKS

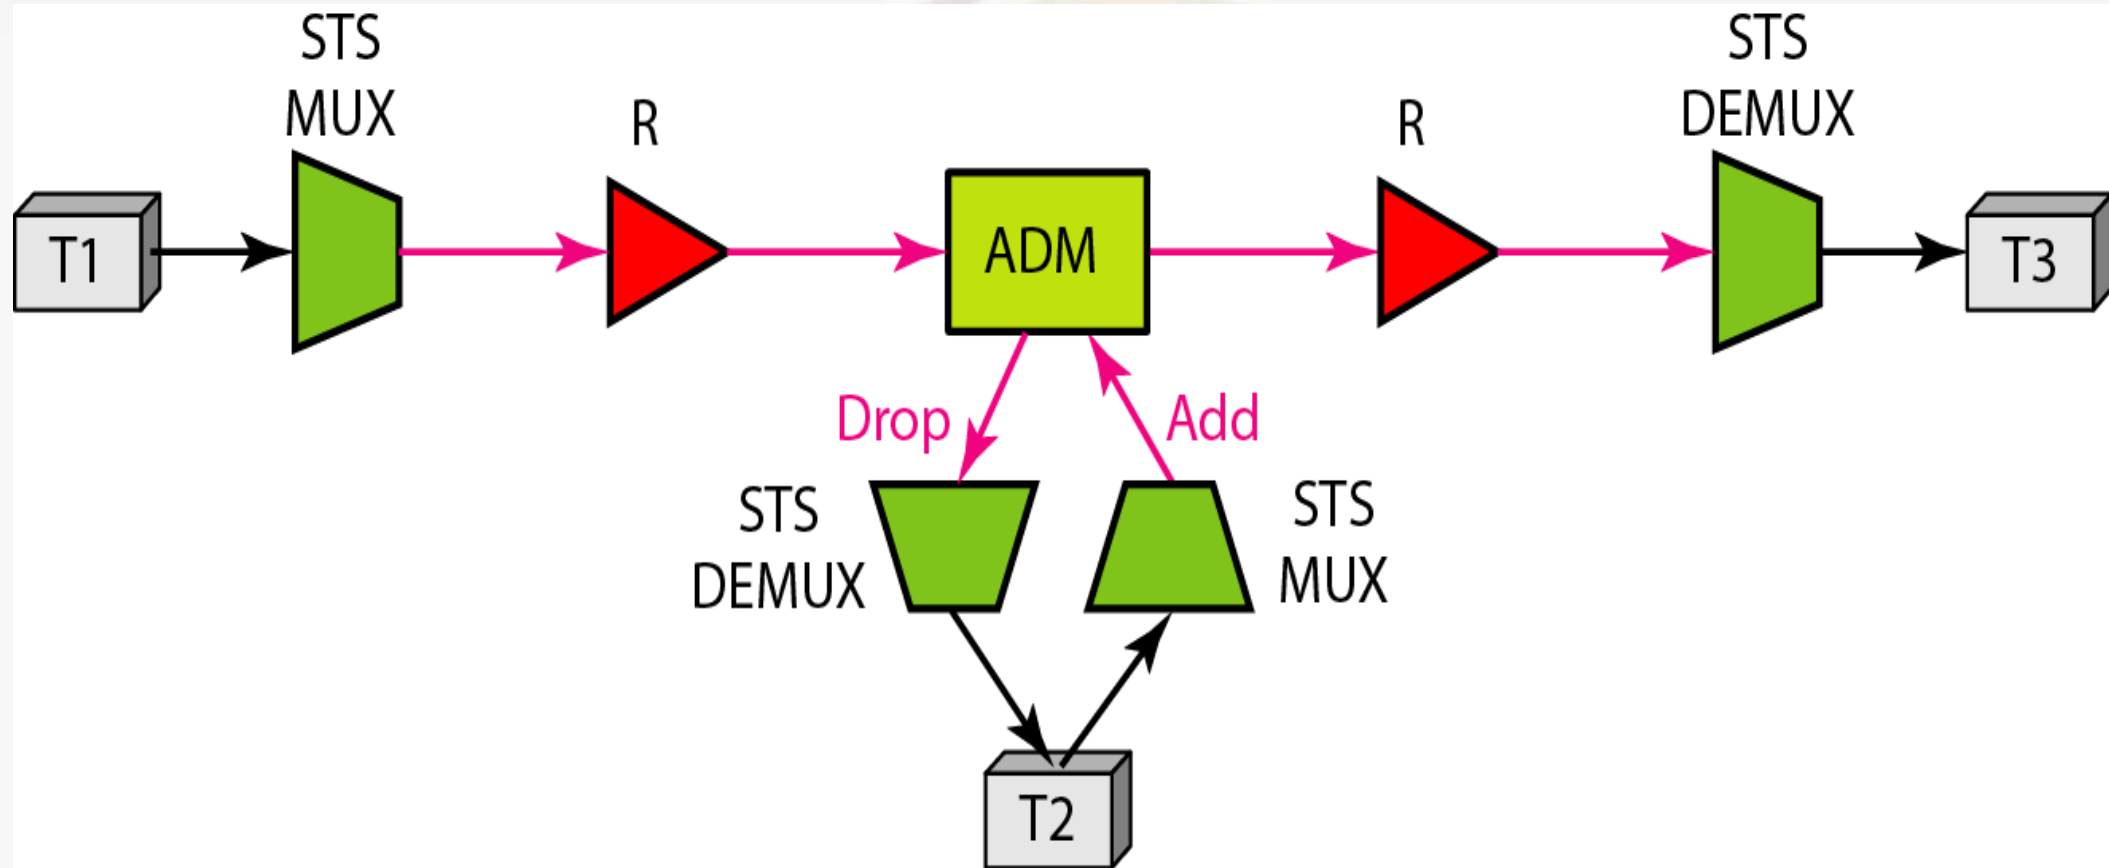

1. Point-to-point network :

School of Electrical, Electronics and Communication

Course Code : BECE3016

Course Name: OPTICAL COMMUNICATION

UNIVERSITY

Name of the Faculty: Dr. Yogesh Kumar

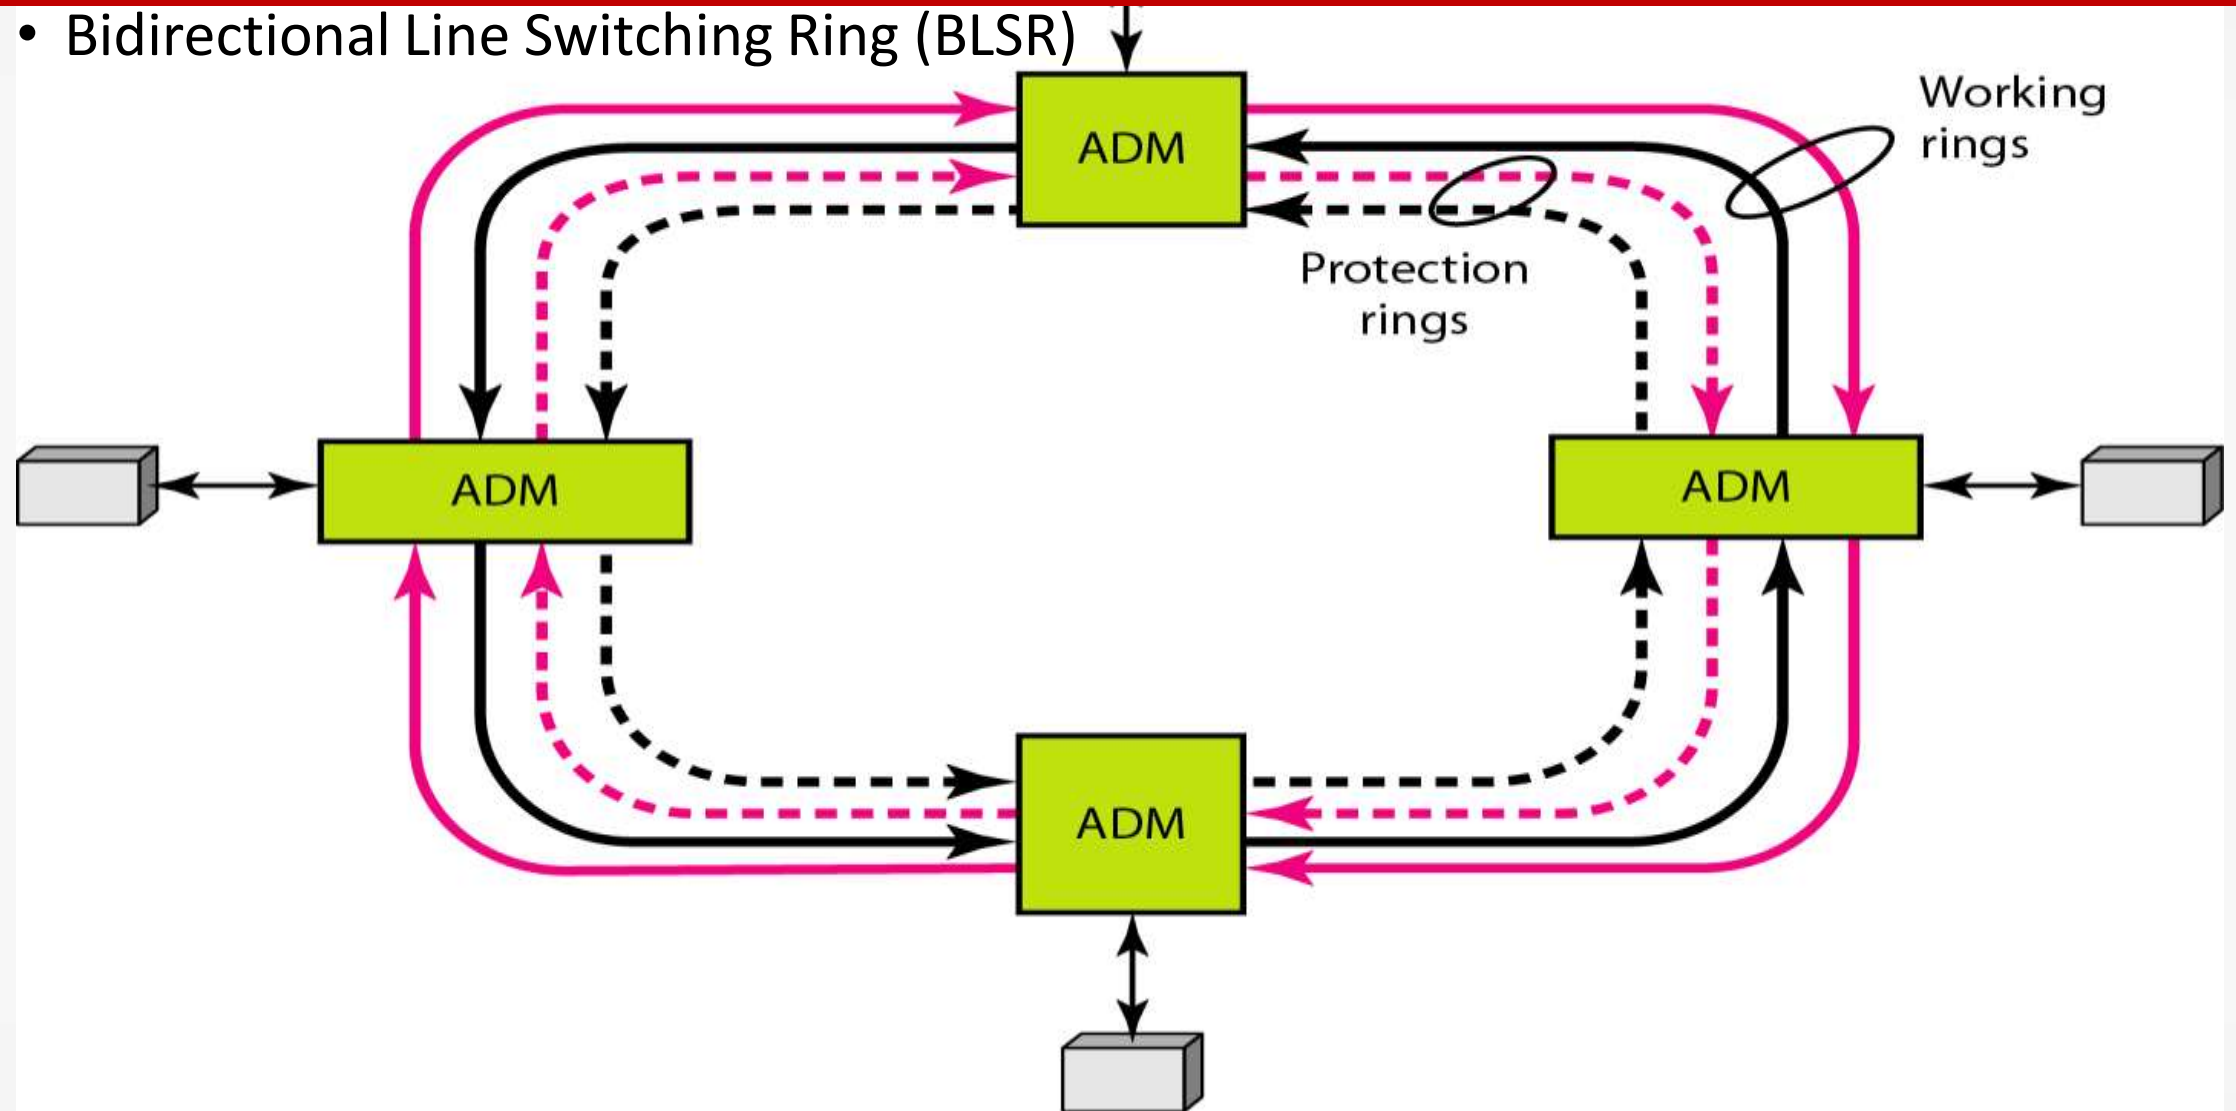

Program Name: B.Tech(ECE)

School of Electrical, Electronics and Communication

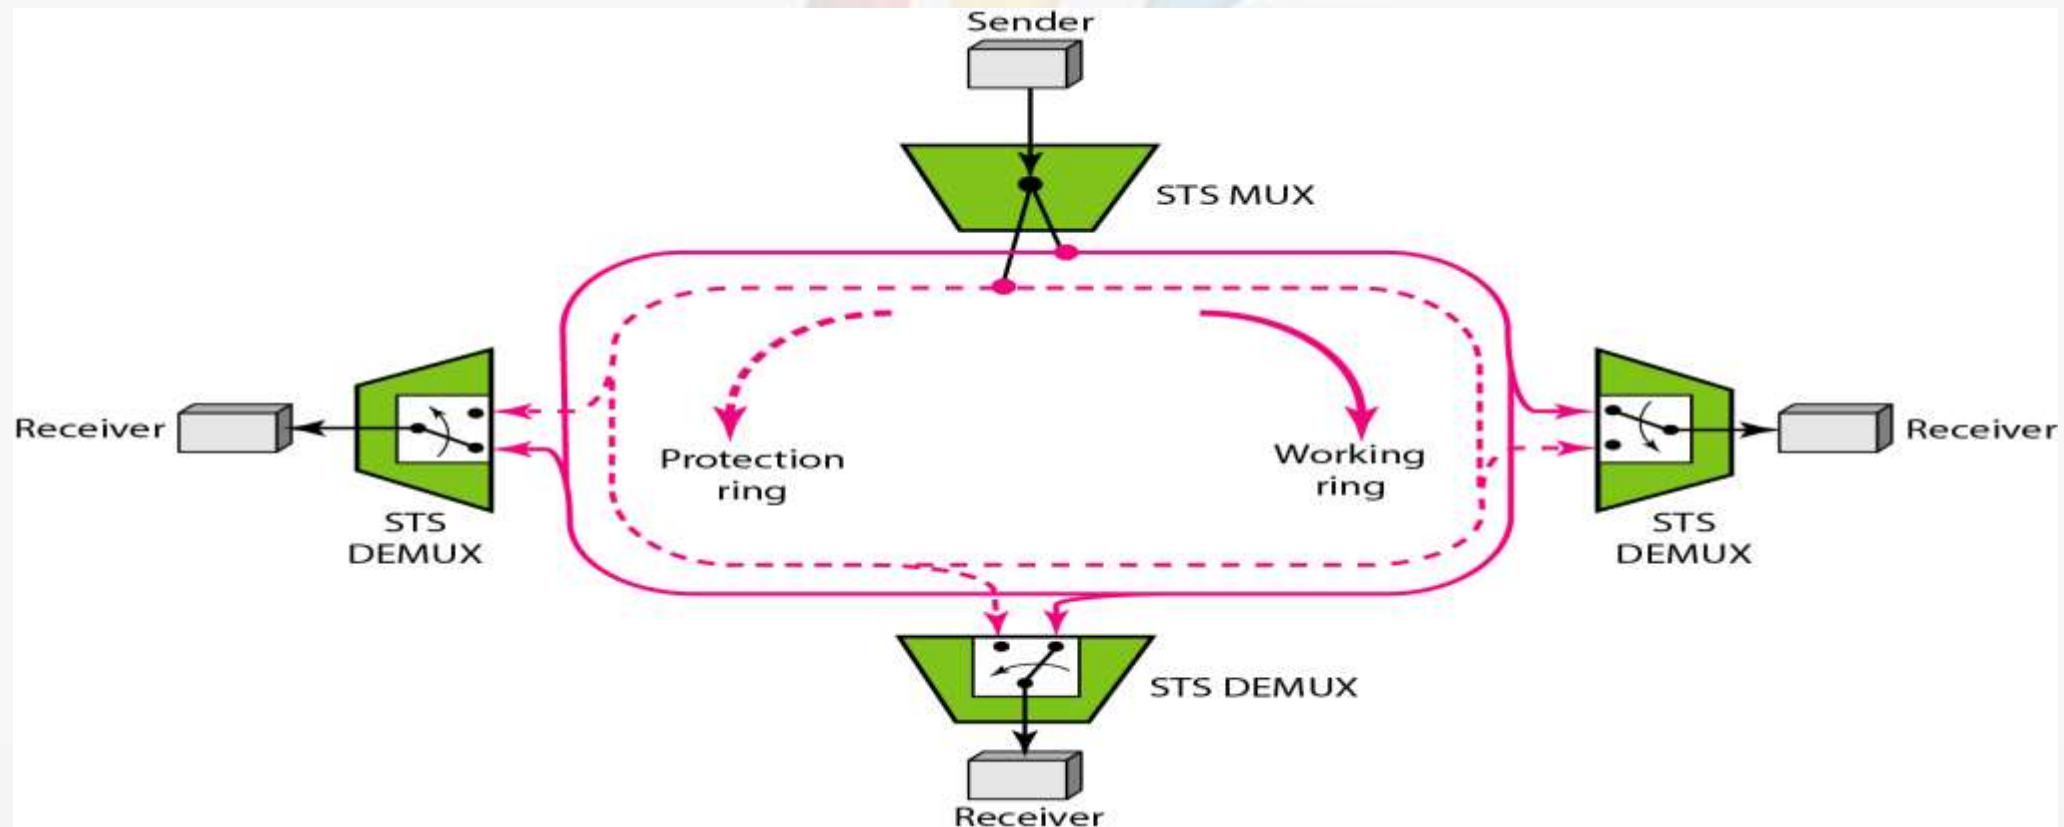

Course Code : BECE3016

Course Name: OPTICAL COMMUNICATION

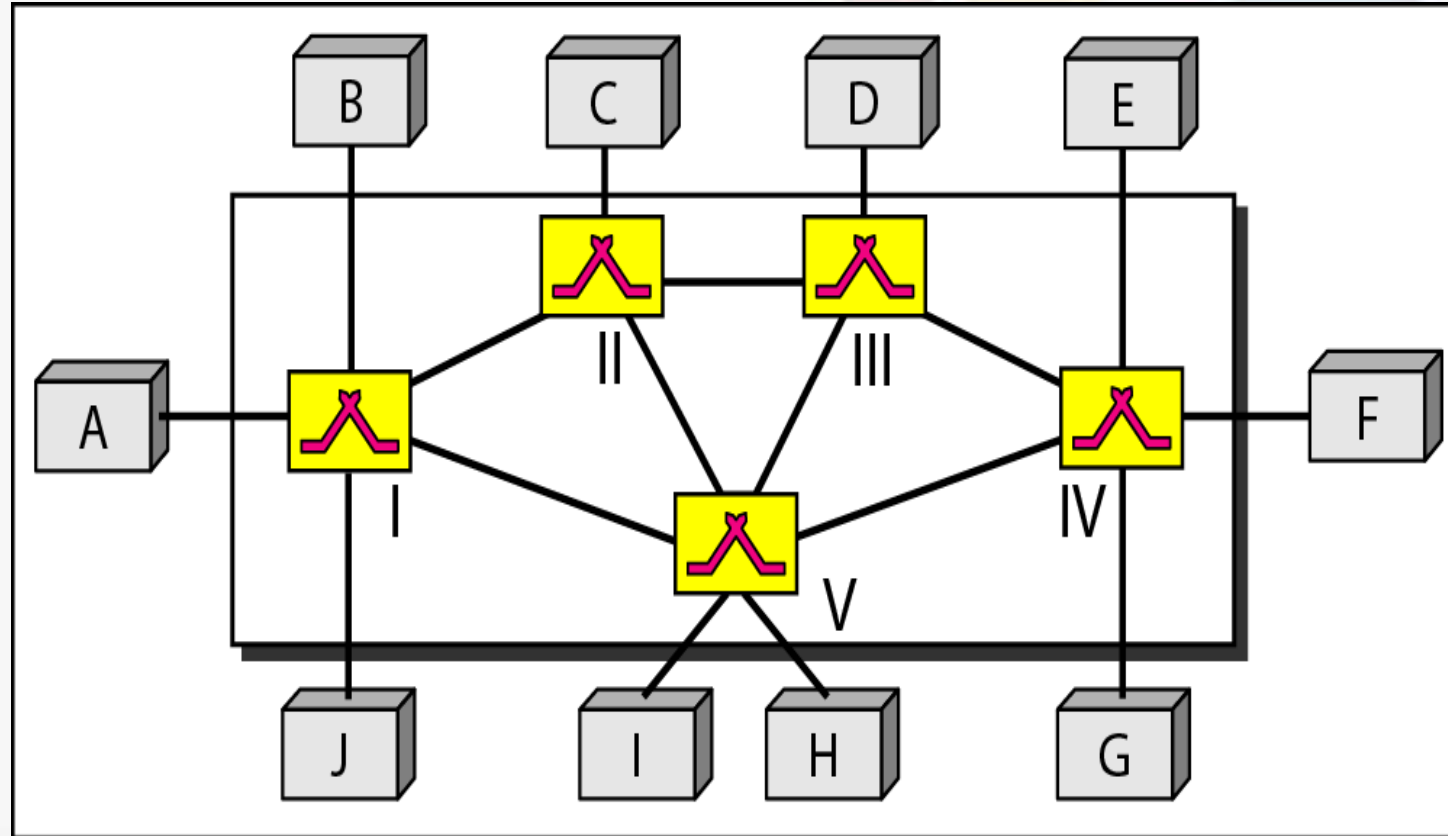

- Bidirectional Line Switching Ring (BLSR)

Ring Network: Unidirectional Path Switching Ring (UPSR)

Mesh Network

a. SONET mesh network

b. Cross-connect switch

ADVANTAGES

Reduced network complexity

Efficient management of bandwidth

Protection
Bandwidth

Flexible Topologies

DISADVANTAGES

- Strict synchronization schemes required
- Complex and costly equipment as compared to cheaper Ethernet

GALGOTIAS
UNIVERSITY

The logo of Galgotias University is a stylized 'G' composed of several overlapping, curved bands in shades of yellow, orange, and blue, set against a light grey circular background.
