Binomial Heap

(Established under Galgotias University Uttar Pradesh Act No. 14 of 2011)

July 2020 (Be safe and stay at home)

Priority queue data type

A min-oriented priority queue supports the following core operations:

- MAKE-HEAP(): create an empty heap.
- INSERT(*H*, *x*): insert an element *x* into the heap.
- EXTRACT-MIN(*H*): remove and return an element with the smallest key.
- DECREASE-KEY(H, x, k): decrease the key of element x to k.

The following operations are also useful:

- IS-EMPTY(H): is the heap empty?
- FIND-MIN(*H*): return an element with smallest key.
- DELETE(*H*, *x*): delete element *x* from the heap.
- MELD(H_1 , H_2): replace heaps H_1 and H_2 with their union.

Note. Each element contains a key (duplicate keys are permitted) from a totally-ordered universe.

Priority queue applications

Applications.

- A* search.
- Heapsort.
- Online median.
- Huffman encoding.
- Prim's MST algorithm.
- · Discrete event-driven simulation.
- Network bandwidth management.
- Dijkstra's shortest-paths algorithm.
- ...

SECTION 2.4

PRIORITY QUEUES

binary heaps

- d-ary heaps
- binomial heaps
- Fibonacci heaps

Course: Design & Analysis of an Algorithm

Course Code: BCSE3031

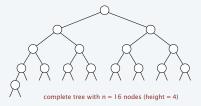

Mr. Ankit Kumar

Complete binary tree

Binary tree. Empty or node with links to two disjoint binary trees.

Complete tree. Perfectly balanced, except for bottom level.

Property. Height of complete binary tree with n nodes is $\lfloor \log_2 n \rfloor$.

Pf. Height increases (by 1) only when *n* is a power of 2. •

A complete binary tree in nature

Course: Design & Analysis of an Algorithm

Course Code: BCSE3031

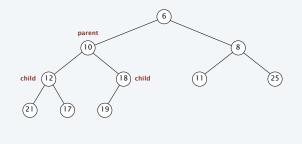

Mr. Ankit Kumar

Binary heap

Binary heap. Heap-ordered complete binary tree.

Heap-ordered tree. For each child, the key in child \geq key in parent.

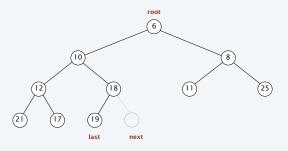

Explicit binary heap

Pointer representation. Each node has a pointer to parent and two children.

- Maintain number of elements n.
- · Maintain pointer to root node.
- Can find pointer to last node or next node in $O(\log n)$ time.

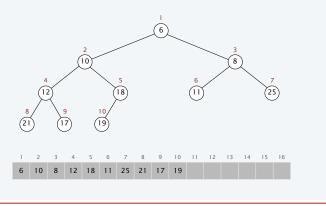

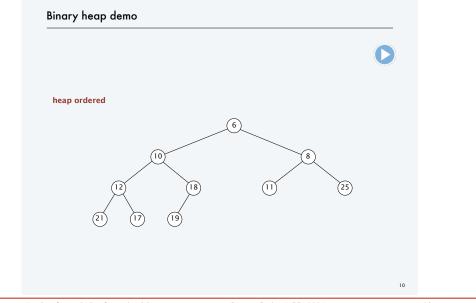

Implicit binary heap

Array representation. Indices start at 1.

- Take nodes in level order.
- Parent of node at k is at $\lfloor k/2 \rfloor$.
- Children of node at k are at 2k and 2k + 1.

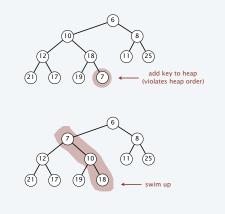

Binary heap: insert

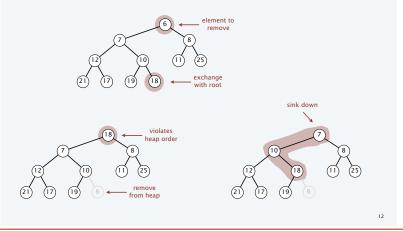

Insert. Add element in new node at end; repeatedly exchange new element with element in its parent until heap order is restored.

Binary heap: extract the minimum

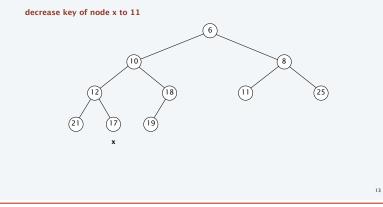

Extract min. Exchange element in root node with last node; repeatedly exchange element in root with its smaller child until heap order is restored.

Binary heap: decrease key

Decrease key. Given a handle to node, repeatedly exchange element with its parent until heap order is restored.

Binary heap: analysis

Theorem. In an implicit binary heap, any sequence of *m* INSERT, EXTRACT-MIN, and DECREASE-KEY operations with *n* INSERT operations takes $O(m \log n)$ time. Pf.

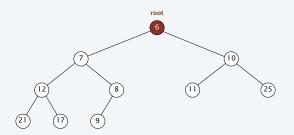

- Each heap op touches nodes only on a path from the root to a leaf; the height of the tree is at most log₂ *n*.
- The total cost of expanding and contracting the arrays is O(n).

Theorem. In an explicit binary heap with n nodes, the operations INSERT, DECREASE-KEY, and EXTRACT-MIN take $O(\log n)$ time in the worst case.

Binary heap: find-min

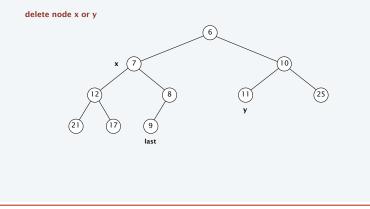

Find the minimum. Return element in the root node.

Binary heap: delete

Delete. Given a handle to a node, exchange element in node with last node; either swim down or sink up the node until heap order is restored.

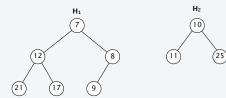

Binary heap: meld

Meld. Given two binary heaps H_1 and H_2 , merge into a single binary heap.

Observation. No easy solution: $\Omega(n)$ time apparently required.

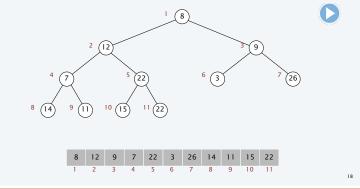

Binary heap: heapify

Heapify. Given *n* elements, construct a binary heap containing them. Observation. Can do in $O(n \log n)$ time by inserting each element.

Bottom-up method. For i = n to 1, repeatedly exchange the element in node i with its smaller child until subtree rooted at i is heap-ordered.

Course Code: BCSE3031

Binary heap: heapify

Theorem. Given *n* elements, can construct a binary heap containing those *n* elements in O(n) time.

Pf.

- There are at most $[n/2^{h+1}]$ nodes of height *h*.
- The amount of work to sink a node is proportional to its height *h*.
- Thus, the total work is bounded by:

$$\sum_{h=0}^{\lfloor \log_2 n \rfloor} \lceil n/2^{h+1} \rceil h \leq \sum_{h=0}^{\lfloor \log_2 n \rfloor} n h/2^h \sum_{i=1}^{k} \frac{i}{2^i} = 2 - \frac{k}{2^k} - \frac{1}{2^{k-1}}$$

Corollary. Given two binary heaps H_1 and H_2 containing *n* elements in total, can implement MELD in O(n) time.

Binomial heaps

S.L. Graham, R.L. Rivest Editors

A Data Structure for Manipulating Priority Queues

Jean Vuillemin Université de Paris-Sud

Programming

Techniques

A data structure is described which can be used for representing a collection of priority queues. The primitive operations are insertion, deletion, union, update, and search for an item of carliest priority. Key Words and Phrases data structures, implementation of set operations, priority queues, mergeable heaps, hinary trees

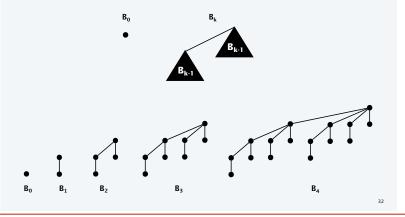

CR Categories: 4.34, 5.24, 5.25, 5.32, 8.1

Binomial tree

Def. A binomial tree of order *k* is defined recursively:

- Order 0: single node.
- Order k: one binomial tree of order k 1 linked to another of order k 1.

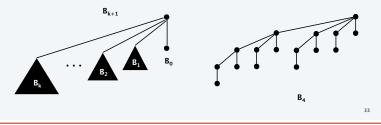

Binomial tree properties

Properties. Given an order k binomial tree B_k ,

- Its height is k.
- It has 2^k nodes.
- It has $\binom{k}{i}$ nodes at depth *i*.
- The degree of its root is *k*.
- Deleting its root yields k binomial trees $B_{k-1}, ..., B_0$.

Pf. [by induction on k]

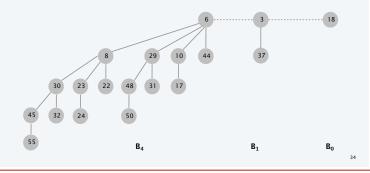

Binomial heap

Def. A binomial heap is a sequence of binomial trees such that:

- Each tree is heap-ordered.
- There is either 0 or 1 binomial tree of order *k*.

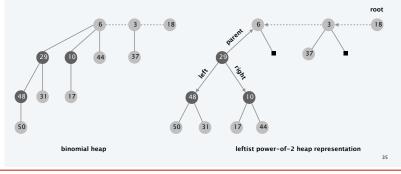

Binomial heap representation

Binomial trees. Represent trees using left-child, right-sibling pointers.

Roots of trees. Connect with singly-linked list, with degrees decreasing from left to right.

Course: Design & Analysis of an Algorithm

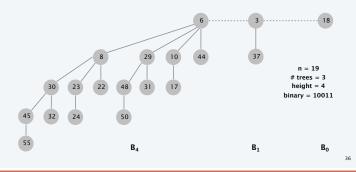

Course Code: BCSE3031

Binomial heap properties

Properties. Given a binomial heap with *n* nodes:

- The node containing the min element is a root of $B_0, B_1, ..., \text{ or } B_k$.
- It contains the binomial tree B_i iff $b_i = 1$, where $b_k \cdot b_2 b_1 b_0$ is binary representation of n.
- It has $\leq \lfloor \log_2 n \rfloor + 1$ binomial trees.
- Its height $\leq \lfloor \log_2 n \rfloor$.

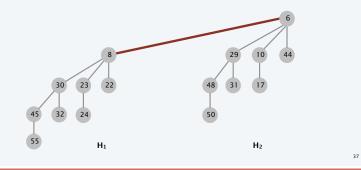

Binomial heap: meld

Meld operation. Given two binomial heaps H_1 and H_2 , (destructively) replace with a binomial heap H that is the union of the two.

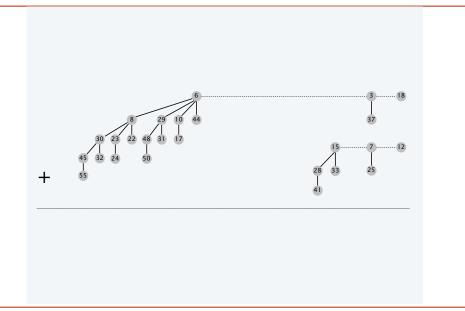

Warmup. Easy if H_1 and H_2 are both binomial trees of order k.

- Connect roots of *H*₁ and *H*₂.
- Choose node with smaller key to be root of *H*.

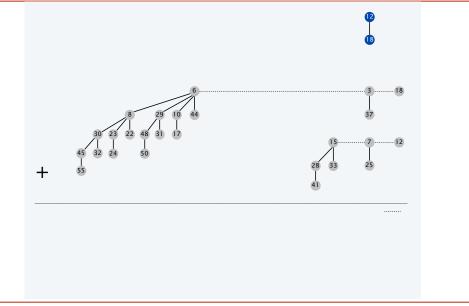

Course: Design & Analysis of an Algorithm

Course Code: BCSE3031

Binomial heap: meld

Meld operation. Given two binomial heaps H_1 and H_2 , (destructively) replace with a binomial heap H that is the union of the two.

Solution. Analogous to binary addition.

Running time. $O(\log n)$.

Pf. Proportional to number of trees in root lists $\leq 2(\lfloor \log_2 n \rfloor + 1)$.

			1	1	1	
		1	0	0	1	1
19 + 7 = 26	+	0	0	1	1	1
		1	1	0	1	0

Binomial heap: extract the minimum

Extract-min. Delete the node with minimum key in binomial heap *H*.

• Find root *x* with min key in root list of *H*, and delete.

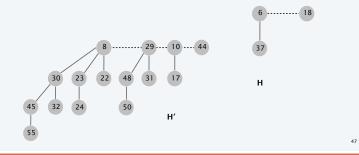

Binomial heap: extract the minimum

Extract-min. Delete the node with minimum key in binomial heap *H*.

- Find root *x* with min key in root list of *H*, and delete.
- $H' \leftarrow$ broken binomial trees.
- $H \leftarrow \mathsf{MELD}(H', H)$.

Course: Design & Analysis of an Algorithm

Course Code: BCSE3031

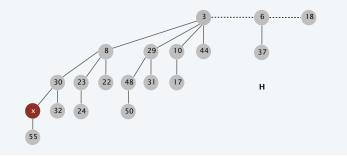

Binomial heap: decrease key

Decrease key. Given a handle to an element *x* in *H*, decrease its key to *k*.

- Suppose *x* is in binomial tree *B_k*.
- Repeatedly exchange *x* with its parent until heap order is restored.

Running time. $O(\log n)$.

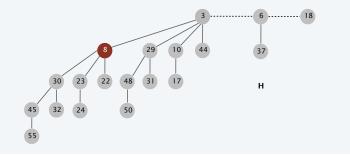

Binomial heap: delete

Delete. Given a handle to an element *x* in a binomial heap, delete it.

- DECREASE-KEY($H, x, -\infty$).
- DELETE-MIN(*H*).

Running time. *O*(log *n*).

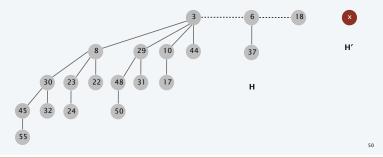

Binomial heap: insert

Insert. Given a binomial heap *H*, insert an element *x*.

- $H' \leftarrow \mathsf{MAKE-HEAP}()$.
- $H' \leftarrow \mathsf{INSERT}(H', x)$.
- $H \leftarrow \mathsf{MELD}(H', H)$.

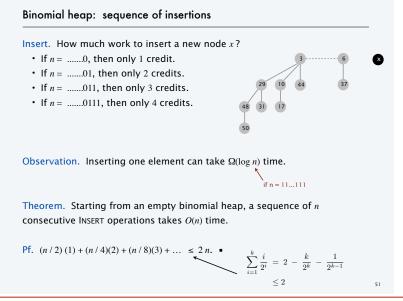

Running time. $O(\log n)$.

Course: Design & Analysis of an Algorithm

Course Code: BCSE3031

Course Code: BCSE3031

Binomial heap: amortized analysis

Theorem. In a binomial heap, the amortized cost of INSERT is O(1) and the worst-case cost of EXTRACT-MIN and DECREASE-KEY is $O(\log n)$.

- Pf. Define potential function $\Phi(H_i) = trees(H_i) = \#$ trees in binomial heap H_i .
 - $\Phi(H_0) = 0$.
 - $\Phi(H_i) \ge 0$ for each binomial heap H_i .

Case 1. [INSERT]

- Actual cost c_i = number of trees merged + 1.
- $\Delta \Phi = \Phi(H_i) \Phi(H_{i-1}) = 1 \text{number of trees merged.}$
- Amortized cost = $\hat{c}_i = c_i + \Phi(H_i) \Phi(H_{i-1}) = 2$.

Binomial heap: amortized analysis

Theorem. In a binomial heap, the amortized cost of INSERT is O(1) and the worst-case cost of EXTRACT-MIN and DECREASE-KEY is $O(\log n)$.

- Pf. Define potential function $\Phi(H_i) = trees(H_i) = \#$ trees in binomial heap H_i .
 - $\Phi(H_0) = 0$.
 - $\Phi(H_i) \ge 0$ for each binomial heap H_i .

Case 2. [DECREASE-KEY]

- Actual cost $c_i = O(\log n)$.
- $\Delta \Phi = \Phi(H_i) \Phi(H_{i-1}) = 0.$
- Amortized cost = $\hat{c}_i = c_i = O(\log n)$.

Binomial heap: amortized analysis

Theorem. In a binomial heap, the amortized cost of INSERT is O(1) and the worst-case cost of EXTRACT-MIN and DECREASE-KEY is $O(\log n)$.

- Pf. Define potential function $\Phi(H_i) = trees(H_i) = \#$ trees in binomial heap H_i .
 - $\Phi(H_0) = 0$.
 - $\Phi(H_i) \ge 0$ for each binomial heap H_i .

Case 3. [EXTRACT-MIN or DELETE]

- Actual cost $c_i = O(\log n)$.
- $\Delta \Phi = \Phi(H_i) \Phi(H_{i-1}) \leq \Phi(H_i) \leq \lfloor \log_2 n \rfloor.$
- Amortized cost = $\hat{c}_i = c_i + \Phi(H_i) \Phi(H_{i-1}) = O(\log n)$.
