**SCHOOL OF COMPUTING SCIENCE  
AND ENGINEERING  
GALGOTIAS UNIVERSITY, GREATER  
NOIDA**

**CANDIDATE'S DECLARATION**

We hereby certify that the work which is being presented in the project, entitled **“Easy Ride - Carpooling”** in partial fulfillment of the requirements for the award of the **BACHELOR OF TECHNOLOGY IN COMPUTER SCIENCE AND ENGINEERING**

submitted in the **School of Computing Science and Engineering** of Galgotias University, Greater Noida, is an original work carried out during the period of **JULY-2021 to DECEMBER-2021**, under the supervision of **Dr. Michael Raj TF, Associate Professor, Department of Computer Science and Engineering** of School of Computing Science and Engineering, Galgotias University, Greater Noida

The matter presented in the project has not been submitted by us for the award of any other degree of this or any other places.

18SCSE1120030 – VARUN VISHWAKARMA

18SCSE1050045 – MUKUND MOONA

This is to certify that the above statement made by the candidates is correct to the best of my knowledge.

Supervisor

(Dr. Michael Raj TF, Associate Professor)

**CERTIFICATE**

The Final Project Viva-Voce examination of **18SCSE1050045 – MUKUND MOONA,**  
**18SCSE1120030 – VARUN VISHWAKARMA** has been held on \_\_\_\_\_ and  
their work is recommended for the award of **BACHELOR OF TECHNOLOGY IN**  
**COMPUTER SCIENCE AND ENGINEERING.**

**Signature of Examiner(s)**

**Signature of Supervisor(s)**

**Signature of Project Coordinator**

**Signature of Dean**

# ABSTRACT

This project “Easy Ride” will be used for online carpooling. It will allow customer to view there pick up point to destination point route and details of car. Now, this is only Delhi local, in future, we will cover all states, cities in India. Carpooling is when two or more persons share a ride in one of their personal cars. Carpooling reduces pollution since we have fewer cars on the road. It’s also economic since the travel expenses are shared among the riders.

This project will help to finding people to share a ride and find a person going to the same place as you at a same time. This project is helpful in carpooling online anywhere around the Delhi. Can be used by anyone who wants to give a ride or take a ride through online. People can interact with business at any hour of the day being convenient

There are various advantages of this project such as:

- Reduce traffic from the road which is a very serious problem now days
- Reduce Pollution which is dangerous to our health.

As a software developer or as a programmer, we are expected to designing and develop every program that works correctly, efficiently and at the same time is easy to be used by any person who may or may not be well versed with the computer and its capabilities. It uses HTML,CSS,JAVASCRIPT in front-end while PHP at back-end. For database we are using relational database management system called MYSQL.

This project is helpful in carpooling online anywhere around the Delhi. Can be used by anyone who wants to give a ride or take a ride through online. People can interact with business at any hour of the day being convenient.

The objective of the proposed software is:-

- To keep records of User, Booking etc.
- It provides very efficient way forgive or take a ride through online.

# INTRODUCTION

This project is helpful in carpooling online anywhere around the Delhi. It can be used by anyone who wants to give a ride or take a ride through online. This project will help to finding people to share a ride and find a person going to the same place as you at a same time . People can interact with business at any hour of the day being convenient.

According to Environment Canada, air pollution caused by vehicular travel is linked to a number of health concerns including respiratory diseases, cardiovascular disease, allergies and neurological effects. By carpooling, you help reduce these health risks for yourself and everyone else. Research also suggests that carpooling is less stressful than commuting alone.

Carpooling offers a commuter option that may work better than other methods of transportation. Carpooling works best for people who live where transit service may be limited or non-existent and compared to other options, carpooling may better fit your schedule.

There are various advantages of this project such as:

- Reduce traffic from the road which is a very serious problem now days.
- Reduce Pollution which is dangerous to our health.
- Save the money as well
- It's a very use in odd-even rule time.
- Anyone who want to start giving a ride. They can provide the all details (like car number, RC, etc.) on Internet using Easy Ride (Carpooling).

# FORMULATION OF PROBLEM

Problem identification is very first step of system analysis. The analyst meets with the customer and the end user. Here customers are the marketing persons and end-user are people .

In this step, we are interested to understand the product's objective and also defined the goals for fulfilling the requirement according to the objective. After identifying overall goals, we moved towards evaluation of supplementary information during preliminary investigation. We also focused on "Does the technology exist to build the system?" and "What bounds have been placed on costs and schedule?"

To perform it we scanned followings:

- ❖ The performance of the system
- ❖ The information being supplied and its form
- ❖ The economy of processing
- ❖ The control of the information processing
- ❖ The efficiency of the existing system
- ❖ The security of the data &

# TECHNOLOGY USED

## HTML

HTML (Hypertext Markup Language) is the predominant markup language for web pages. It provides a means to describe the structure of text-based information in a document by denoting certain text as headings, paragraphs, lists, and so on and to supplement that text with interactive forms, embedded images, and other objects. HTML is written in the form of labels (known as tags), surrounded by angle brackets.

Advantages of HTML are:-

- A HTML document is small and hence easy to send over the net. It is small because it does not include formatted information.
- HTML is platform independent.
- HTML tags are not case-sensitive.

## JAVASCRIPT

JavaScript is a script-based programming language that was developed by Netscape Communication Corporation. JavaScript was originally called Live Script and renamed as JavaScript to indicate its relationship with Java. JavaScript supports the development of both client and server components of Web-based applications. On the client side, it can be used to write programs that are executed by a Web browser within the context of a Web page. On the server side, it can be used to write Web server programs that can process information submitted by a Web browser and then update the browser's display accordingly.

## CSS

Cascading Style Sheets (CSS) is a style sheet language used to describe the presentation of a document written in HTML or XML (including XML dialects such as SVG or XHTML). CSS describes how elements should be rendered on screen, on paper, in speech, or on other media

## PHP

PHP is a server-side scripting language designed specifically for web development. PHP can be easily embedded in HTML files and HTML codes can also be written in a PHP file. The thing that differentiates PHP with client-side language like HTML is, PHP codes are executed on the server whereas HTML codes are directly rendered on the browser.

## MySQL

MySQL is a relational database management system based on SQL – Structured Query Language. The application is used for a wide range of purposes, including data warehousing, e-commerce, and logging applications. The most common use for MySQL however, is for the purpose of a web database.

# LITERATURE SURVEY

Traffic congestion and air pollution have become major public issues in metropolitan areas. Faced with inadequate financial resources for major transportation improvements, and often with environmental constraints that preclude major improvements, public decision-makers are increasingly turning toward strategies that attempt to reduce congestion and air pollution by managing" travel demand.

Carpooling system is used in many countries like China 77% had heard of carpooling and 16% was used. After this survey they did attitudinal questions towards carpooling, then survey was interested in carpooling were 62% and 38% were not interested. They used many means to come in contact with people like Newspapers, Internet, Friends, Colleagues, and Radios. These all means were used for people to get carpooling information.

Did you know that here in Maharashtra State, petroleum used for transportation is the number one source of air toxins and greenhouse gas emissions, a major contributor to global warming? Each of us can reduce our impact on the environment. Think about it – every time two people share a ride, they're helping to reduce emissions from cars by half! Reducing vehicle emissions helps combat global warming, improves air quality and has positive effects on public health. And who hasn't been stuck in traffic recently? The World watch Institute found that the average Maharashtra adult now spends 72 minutes per day behind the wheel, often alone. Carpooling cuts down on congestion, which cuts travel time. This project "EASY RIDE" helps to carpooling and helps to save time on roads as well as save this environment from harmful gases.

# DATA FLOW DIAGRAM

Data flow diagrams are widely used for modeling for requirements. DFDs show the flow of data through a system. The DFD is also known as a data flow graph or a bubble chart.

Standard symbol used for DFD

*1.DATA FLOW*

It is used to connect processes to each other, to sources or sinks, the arrowhead indication the direction of data flow.

*2.PROCESS*

It is used to represent some transformation of input data to yield output data.

*3.SOURCE*

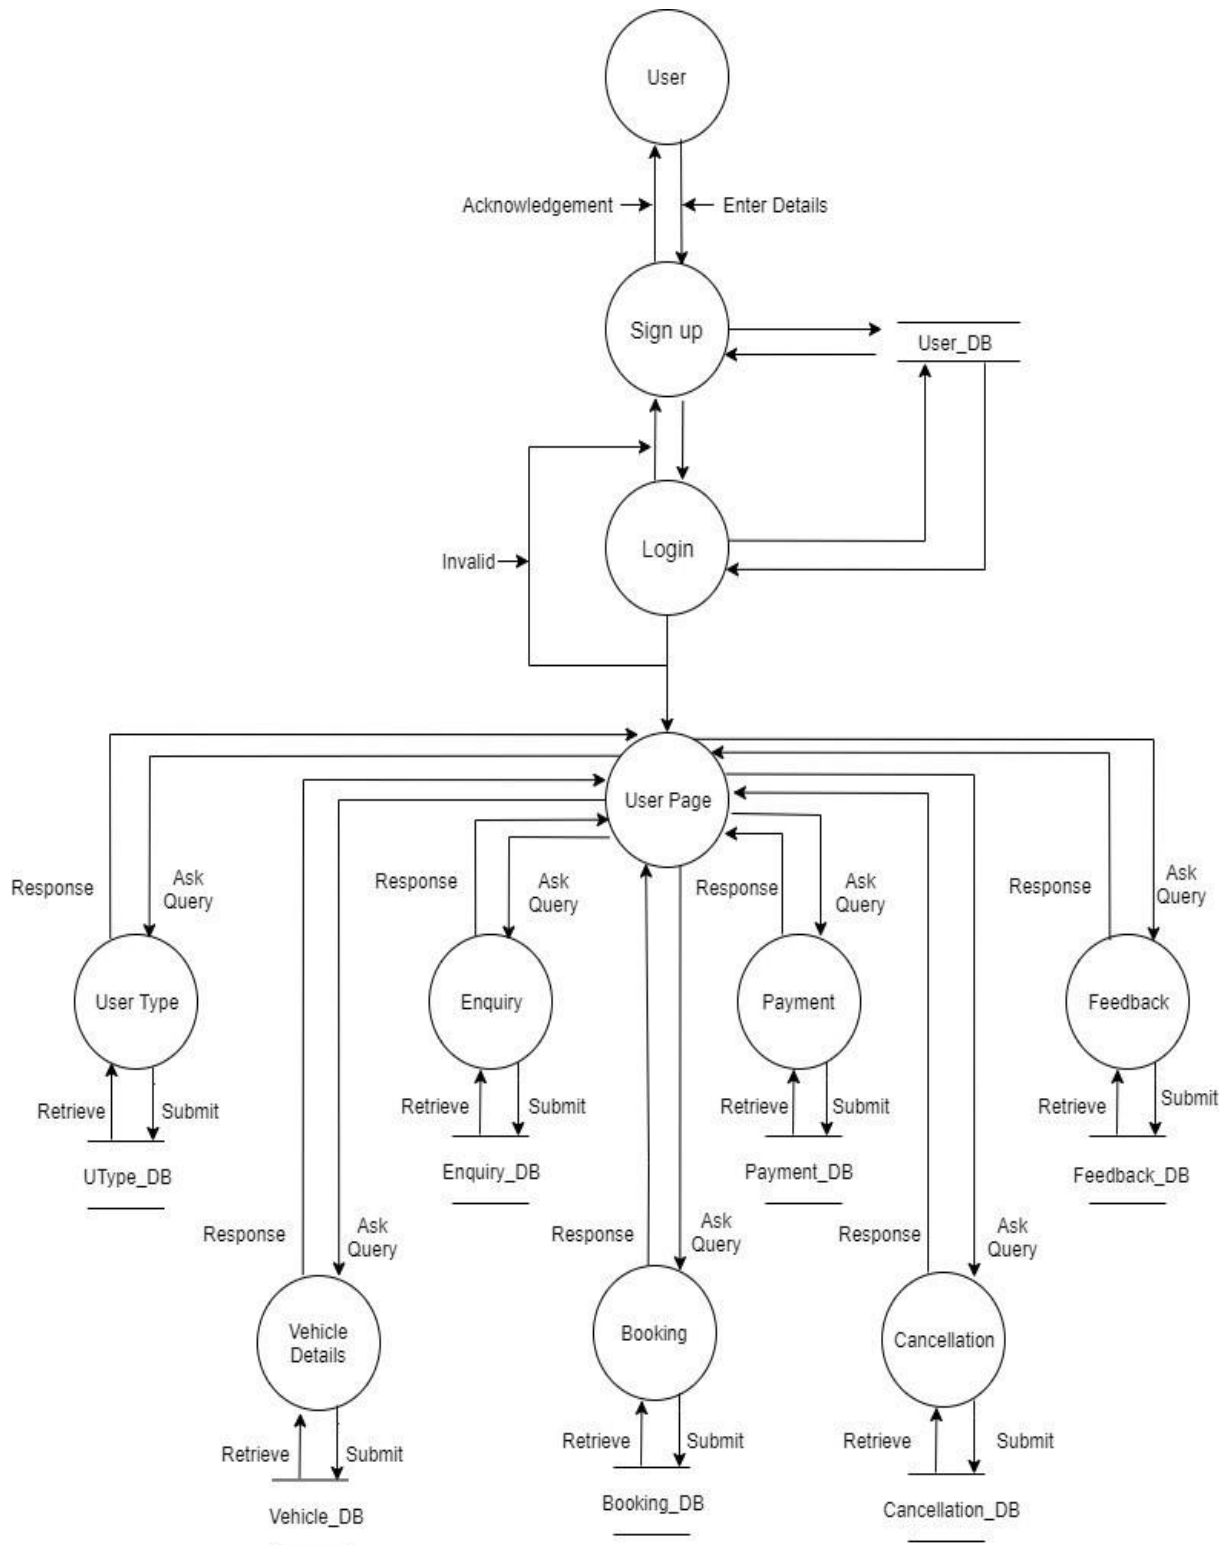

A source of system input or sinks of system outputs.

*4.DATA SOURCE*

It is used for repository of data. The arrowheads indicate net inputs and net outputs.

# User's 1<sup>st</sup> Level DFD

# E-R diagram

An Entity-Relationship (ER) Diagram is a specialized graphic that illustrates the interrelationships between entities in a database. ER diagrams often use symbols to represent three different types of information. Boxes are commonly used to represent entities. Diamonds are normally used to represent relationships and ovals are used to represent attributes. If the application is primarily a database application, the entity-relationship approach can be used effectively for modeling some parts of the problem. The main focus in ER modeling is the Data Items in the system and the relationship between them. It aims to create conceptual scheme for the Data from the user's perspective. The model thus created is independent of any models are:

## Symbols used in E-R diagram

### Entity box

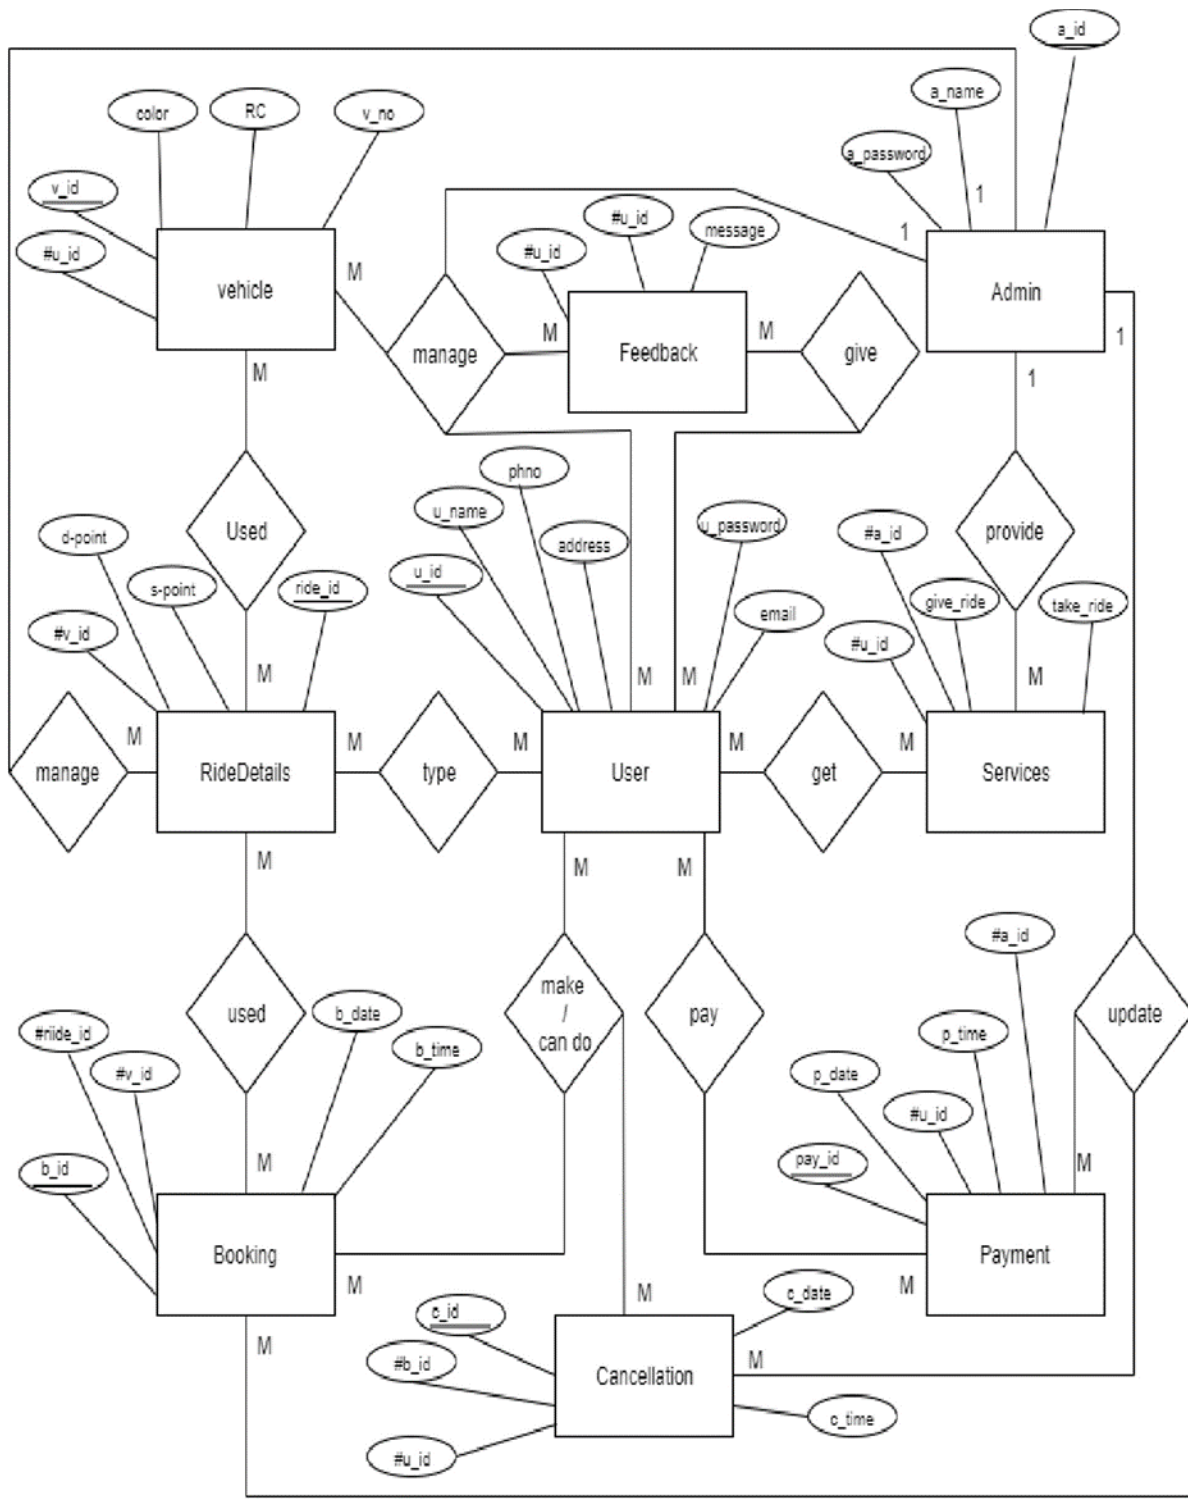

This box contains a particular Entity, which may be any object of real world or hypothetical object.

### Attribute symbol

This symbol is used or defining the attributes of a particular entity.

### Diagonal symbol

This symbol is used to establish relationship among various departments or clients, which may also have, attribute

## Tables

<b>Attribute</b>	<b>Data type</b>	<b>Description</b>	<b>Keys</b>
u_id	Varchar(20)	Id of the user	Primary key
u_name	Char	Name of the user	not null
u_password	vvarchar(15)	Password of the user	not null
Address	vvarchar(100)	Address of the user	not null
Phno	integer(12)	Phone number of the user	not null
Email	vvarchar(30)	Email id of the user	not null

### **Admin**

<b>Attribute</b>	<b>Data type</b>	<b>Description</b>	<b>Keys</b>
a_id	vvarchar(20)	Id of the admin	Primary key
a_name	Char	Name of the user	not null
a_password	vvarchar(15)	Password of the admin	not null

### **Services**

<b>Attribute</b>	<b>Data type</b>	<b>Description</b>	<b>Keys</b>
u_id	vvarchar(20)	Id of the user	Foreign key
a_id	Varchar(25)	Id of the admin	Foreign key
user_type	Char	User tell about the service	not null
give_ride	Char	User who provides the ride, that the user provides there route details.	not null

take_ride	Char	User who want the ride, that the user provides there route details	not null
-----------	------	--	----------

## Vehicle

Attribute	Data type	Description	Keys
v_id	varchar(20)	Id of the vehicle	Primary key
u_id	varchar(20)	Id of the user	Foreign key
v_no	varchar(12)	Number of the vehicle	not null
RC	varchar(20)	RC of the vehicle	not null
Color	Char	Color of the vehicle	not null

## RideDetails

Attribute	Data type	Description	Keys
ride_id	varchar(20)	id of the ride	Primary key
v_id	varchar(20)	id of the vehicle	Foreign key
s_point	Char	Source point of the ride	not null
d_point	Char	Destination point of the ride	not null

# Modules Description

- **User Registration:** This module will be used by user to register them for booking a car. It will take user name, phone etc.
- **Login:** User and Admin will enter their login id and password for login the program.
- **Vehicle Details:** User will provide their vehicle details.
- **Enquiry:** In this module all information provide to user by query
- **Booking:** This module will be used by user to book their ride.
- **Cancellation:** This module will be used by user to cancel their ride.
- **Payment:** The customer can pay cash after the ride.
- **Feedback:** This module will be used by user for give their feedback for ride.
- **Edit:** This module will be used by administrator to edit user's side system.
- **View:** This module will be used by administrator to view user's side activity.
- **Manage:** This module will be used by administrator to manage user's activity

## **TESTING:-**

Testing is a process or phase in which we check our software that it is providing proper output according to the input or not. In this process we find the problem which comes in the software: -

There are two types of testing:

### **BLACK BOX TESTING:**

This is also called behavior testing or boundary value testing. It works on the functionality of the system. It takes the input according to the system performance and provides the output. In this process we first find out the boundary of the system. For example, for finding odd and even number. We need to input only integer value that means the boundary of the system is the range of integer value.

After defining the boundary, we need to input the value to the system in the range of that boundary. And checks the add it is producing any error or not.

**It finds the error like: -**

- (i) Incorrect or missing function.
- (ii) Interface error.
- (iii) Error in data structure.
- (iv) Behavior or performance error due to syntax missing.
- (v) Initializing or termination error.

### **WHITE BOX TESTING:-**

It is a process in which we design the test cases for the program and uses the control structure for designing the test cases. In this process the software developers keep in mind that what are the limitations and boundaries of the

system. In this process we check both positive and negative aspects of the system. For that we need to use input values which are outside the boundary of the system. And then we get that output.

**It checks the error like:-**

- (i). It checks all logical decisions on their true and false side.
- (ii). It checks that all independent paths within the system have been checked at least once.
- (iii). Execute all loops at their boundaries and within their operational bounds.
- (iv). Checks the internal data structure to ensure their validity.
- (v). All logical errors are checked in white box testing.

Types of testing depending on the testing style:

(i). **UNIT TESTING:** - In this testing we divide the software into its smallest individual subsystem and test that subsystem individually. This approach is helpful when we use procedure-oriented programming for creating software. In this type of software all the functions are tested on some error. When it will be again redesigned the function.

(ii). **INTEGRATED TESTING:** - This testing is also called system testing. In this testing the individual units of software are combined together and tested as a unit. In this testing we provide the actual data to the system and check the output.

**Test case:**

**Test case for login button of the login form:**

*Test case 1:* All the following combinations are tested  
Password is valid and Username is valid

Password is valid and Username is invalid  
Password is invalid and Username is invalid  
Password is invalid and Username is valid

***Expected results:***

No error crossing this stage when Password & Username are both permissible combination of characters. In all other case error message is displayed.

***Test case 2:*** Following input combination is tried where permissible set of characters for username & password are entered which are non-existent in table.

Password is valid, existent and Username is valid, existent  
Password is valid, existent and Username is valid, nonexistent  
Password is valid, nonexistent and Username is valid, existent  
Password is valid, nonexistent and Username is valid, nonexistent

***Expected Results:***

If no entry into the system then error message displayed. And user is linked to the registration page.

***Test Case 3:*** To test this both username & password to be entered must be valid & existent in the registration table.

Password = Valid, Existent ; and

Username = Valid, Existent

Similarly all the other internal paths & logic can be tested.

**VALIDATION CHECKS:-**

This will be as such to maintain consistent and persistent information on the web when most of the project has to deal with uploads so a minor error will down the impression of the company. Therefore,

validation checks by software itself using the flavors of  
Java script and manual checks are also necessary as:-

1. Correct entry of data in the form.
2. Correct updating of question and with most suitable answer etc.

# CONCLUSION

- As we know that due to present situation of pollution many measures are being taken by government, this whole car pool can be a value adds to it.
- Now the promotion of Carpooling is done, much advertisement is being run to promote this concept.
- People can use their car and utilize it in efficient way; it can be used to earn money.
- In future, we may try to add facilities all around cities in India.
- In the future, Security can be enhancing to maintain all the data and information in more secure manner.
